

SRIP: The Steward's Journey

A bounded guide to observation, relationship and support

Working field guide · v0.2 · July 2026

Lars A. Engberg · Spiralweb Stewardship Association · CC BY 4.0

Abstract

This report describes a human-scale entry into regenerative stewardship. A person begins with a real, bounded place, returns to it, records what can honestly be observed, and lets repeated attention shape the next action. Ten square metres may be enough to begin, but it is an invitation rather than a universal unit. The place, its people, and its conditions determine the appropriate scale and form.

The practice is open. Anyone may begin without permission, affiliation, digital access, or a promise of organisational support. Relationship develops more slowly. Recognition, review, funding, representation, and operational partnership require different thresholds of continuity, consent, clarity, and trust. Keeping these pathways distinct protects both the steward and the wider network from premature obligation and capture.

SRIP therefore follows a modest question: how can local observation become more reliable, relational, and supportable without displacing the person or community who holds the work? Its answer is not a fixed scale ladder or a complete governance system. It is a bounded journey through beginning, recurrence, relationship, support, pause, and dignified incompleteness.

Function and lineage

Other Spiralweb publications develop the epistemology of situated observation, the PG Ledger, AI accountability, dashboard guardrails, and the conditions for regenerative support. This report stays closer to the person who begins. It asks what the work looks and feels like at ground level, and how an honest local practice may enter deeper relation without being consumed by administration, ambition, or the needs of a centre.

SRIP stands in the broad lineage of polycentric commons governance associated with Elinor and Vincent Ostrom and many place-based traditions that long precede formal governance theory. Its relevant commitments are practical: boundaries should be clear enough to make responsibility real; rules and interpretations must remain responsive to local conditions; people affected by decisions need meaningful ways to shape and correct them; observation should remain close to consequences; and wider coordination must not erase local authority.

This lineage does not prescribe one land practice, one community form, or one route of growth. It asks that claims remain revisitable, that disagreement can lead to correction, and that connection across places serves memory and learning rather than central control.

Preamble — what you bring

You bring a real place, a body, and a capacity to notice. That is enough to begin.

The place may be a garden, a courtyard, a shared community plot, a school field, a farm, a wetland edge, a habitat corridor, or a food forest in formation. It may be ten square metres or many hectares. The entry point is the same: something bounded enough that you can return, notice change, and take responsibility for what you do.

No expertise is required to begin. No internet connection is required for the field work itself. No particular school of land practice is required. Traditional and Indigenous ecological knowledge, agroforestry, food forest design, permaculture, farming, gardening, habitat care, and methods developed locally over generations may all be valid starting points. Shared tools can help organise attention, but the practice belongs to the place and the people who hold it.

The steward is not a saviour. This is not a hero's journey. The point is not to become indispensable, achieve mastery, or carry the place alone. Good stewardship distributes care, builds continuity beyond the self, and protects against the over-identification that leads to depletion. The practice should remain holdable by ordinary people in imperfect conditions — including fatigue, disruption, conflict, and incompleteness.

What is required is honesty. An honest gap is more valuable than a fabricated green.

I. Begin with a bounded place

A pixel is a bounded place that a person or local group can actually revisit, observe, and care for. It is not a claim that the living world consists of uniform units. It is a discipline of attention: begin where consequence can be seen and where responsibility is not merely abstract.

Ten square metres is one useful invitation. It is small enough to resist inflated ambition, concrete enough to revisit, and large enough for change to become visible. In another setting, the truthful beginning may be smaller, larger, linear, seasonal, or mobile. A courtyard bed, several trees, a section of streambank, a shared school plot, or a bounded dryland trial may each be appropriate. The design is local. The boundary exists to support recurrence, not to impose sameness.

Begin by describing what is already there before deciding what ought to happen. Notice the present condition, existing care, known pressures, prior uses, access rights, water, other species, and the people whose lives are connected to the place. A bounded site is not empty merely because it has not yet entered a programme. Existing practices and obligations are part of the field.

For many stewards, land is also nourishment

Regenerative stewardship is often inseparable from food, medicine, livelihood, dignity, and practical autonomy. A fruit tree, vegetable bed, grazing pattern, seed practice, or local food forest can make ecological care materially relevant in daily life. Governance language should never abstract that relationship away.

Not every bounded place produces food. Waterways, habitat corridors, urban nature, and other living systems may ask for different forms of attention. The common requirement is not a particular output. It is a real relationship with a place and a willingness to let observation correct intention.

II. Observe, return, and keep the record light

The first record may be a dated notebook entry, a sketch, a fixed-point photograph, or a short table. It should be simple enough to repeat. Record what appears to be present, what changed, what you did, what you do not know, and when you intend to return. Significant events — rain, drought, planting, pruning, illness, conflict, harvest, fire, flooding, or a period of absence — may make an additional entry useful.

Possible fields of attention include soil surface, water behaviour, vegetation, other species, biomass, access, use, human effort, and the condition of the people carrying the work. These are prompts, not universal indicators. Their meaning depends on ecosystem, season, history, purpose, and local interpretation. The current PG Ledger guidance offers a fuller structure where more systematic documentation is useful.

Keep different kinds of statement distinct. What was directly observed is not the same as a local interpretation. An interpretation is not the same as a hypothesis. A hypothesis is not the same as a decision. A decision is not yet a result. Preserving these differences makes later correction possible and prevents confidence from arriving before evidence.

The steward's bodily condition and the social atmosphere are relevant forms of evidence, but neither is infallible. Fatigue, excitement, grief, conflict, attachment, and hope may reveal real conditions while also shaping perception. Bodily knowledge, local knowledge, research, institutional records, and practice data should be named for what they are and allowed to question one another.

Local records belong first to the people and place from which they arise. Wider sharing requires consent and a clear purpose. Some material may remain private, some may be shared with trusted partners, and some may enter a public evidence commons. Participation in visibility must be invited, not extracted.

Keep three conditions separately readable

A place may become greener while the people carrying the work go red. A well-organised project may conceal ecological decline. Ecological recovery may coexist with confused agreements or hidden labour. Keep at least three conditions separately visible: the place and its ecology; the viability of the people carrying the work; and the clarity of roles, agreements, and decisions. None should be allowed to cancel the others.

AI assistance and accountability

Direct records should remain distinguishable from later AI-assisted interpretation. AI may help with translation, organisation, memory, comparison, species-identification suggestions, or the generation of hypotheses. Its outputs remain provisional. AI does not authorise ecological readiness, confer field

status, allocate support, or replace local and professional judgment. Where evidence and interpretation conflict, the response is further inquiry and correction rather than automatic deference to any single source. A named human remains responsible for consequential decisions and public claims.

III. Four ways of entering the work

Practice, relationship, recognition, and support are not the same. Confusing them creates false expectations for the steward and an unmanageable burden for any organisation trying to help. Four pathways keep the differences visible.

1. Self-start steward. A person or local group finds the method, begins with a bounded place, keeps a light record, and may never contact Spiralweb. This is not a weak or incomplete case. It is a successful use of an open public method. A practice that works only when a centre is involved is not resilient.

2. Learning contact. Someone seeks orientation, shared learning, or help understanding the public materials. This pathway should remain lightweight and mostly one-to-many. Curiosity does not create an application, a support case, or an obligation to deepen the relationship.

3. Verified relationship. Closer attention becomes possible when enough reality is present: a real place; identifiable people; continuity of observation or practice; consent among those materially affected; and a workable local form for carrying responsibility. Verification here means that the relationship and activity are real and revisitably described. It is not certification of ecological outcomes.

4. Supported steward or field relation. Financial support, operational partnership, or formal representation belongs to the narrowest pathway. It should follow sufficient continuity, purpose, governance clarity, relational trust, and an honest reading of risk. Interest alone is not readiness, and support should never arrive in a form that replaces local authority.

The practice is open. Obligation is not. Anyone may begin. Not everyone thereby enters review, support, representation, or organisational relationship.

IV. From practice to relationship

A steward need not carry the work alone. Local groups can distribute observation, care, memory, hospitality, conflict work, and practical responsibility. Children, young people, working-age adults, and elders may notice different things and inhabit different time horizons. Their participation should be real, consent-based, and suited to the place rather than symbolically added to a predetermined model.

Spiralweb carries a lineage of small circles, including the Circle of 13. Thirteen may be a fruitful convening form in some settings, but it is neither a universal optimum nor an entry requirement. A local circle is credible when its members are real, its roles are sufficiently legible, its differences can be voiced, and responsibility can continue when one person pauses. The place determines what number and form can be carried.

Where a formal Spiralweb relationship develops, it should be held through a real, place-bound human relationship rather than a remote intake system alone. An AnchorPoint is such a threshold: a person or group able to know the place and people, hold continuity, and translate between lived conditions and wider documentation without taking authority away from the local field.

An AnchorPoint is not required for self-starting practice. Connection follows relationship, and relationship follows time, trust, consent, correction, and visible continuity. It cannot be rushed.

V. Support without capture

Regenerative work takes place in a field shaped by land, livelihood, water, food, institutional finance, philanthropy, state programmes, and private capital. Local stewards may carry the living consequences while larger actors arrive with faster resources and more abstract categories. Support can be necessary and beneficial. It can also displace the people, rhythms, and meanings it claims to serve.

A request should enter closer human review only when minimum conditions are present: a real place or bounded activity is identified; real people can be named; enough continuity exists to distinguish practice from projection; the purpose of support is stated; relevant consent and decision conditions are sufficiently clear; and the request can be discussed without inventing certainty.

The burden test

Every public entry pathway should be tested against one question: *If 10,000 more people did this tomorrow, would the centre become heavier?* If 10,000 people read the method and begin locally, the centre should not inherit 10,000 cases. If every beginner is treated as a candidate for funding or formal relation, openness becomes an intake crisis. The design must prevent living attention from being converted too early into central case load.

Most participants should be able to remain self-starting. Many relations can remain local. Some may develop peer groups or place-bound circles. A smaller number may enter closer organisational relationship or support. Maturity should create distributed capacities rather than a progressively heavier centre.

First stand, then help

Help should grow from demonstrated capacity, experience, and relationship — not from identification with a helper role. The maturity rule is simple: *first stand, then help*. This does not prescribe a single sequence or deny mutual aid at the beginning. It asks that offers of guidance, representation, or expansion remain proportionate to what a person or group can truthfully carry.

A related principle governs resources and attention: *Flow must not arrive faster than the living system can absorb without distortion*. Money, visitors, data demands, institutional recognition, and rapid expansion can all overwhelm a place. Readiness is not reluctance. It is the capacity to receive without losing ecological, social, or decision-making integrity.

VI. What connection may make possible

When a steward freely connects part of their practice to a wider network, several things may become possible: longer memory, access to peers, translation, comparison across seasons and places, correction of assumptions, shared learning, practical solidarity, and a clearer account of where support is or is not useful.

These possibilities are not automatic. Records gathered under different conditions cannot simply be aggregated as if they meant the same thing. Cross-place learning requires context, uncertainty, and limits of translation to remain visible. A local contradiction may correct a public method, but no single observation settles every question.

The network's purpose is not to make each place report to a centre. It is to support memory, correction, connection, and the careful recognition of patterns that no one place can see alone. Local authority and withdrawal rights remain intact. Connection should enlarge the field's capacities, not turn it into a delivery unit for a distant architecture.

VII. Practical surfaces

The entry should remain light, but a few practical surfaces can prevent confusion among practice, relationship, review, and support.

- 1. A simple pathway distinction.** An inquiry can be understood as self-starting practice, learning contact, a possible verified relationship, or an explicit support request. This distinction keeps access to a public method separate from access to organisational time and money.
- 2. A first entry record.** A useful beginning may include a place identifier, date, person or local group, one image or sketch, a short description of present conditions, what was directly observed, what remains uncertain, and an intention for the next return. The purpose is not complete data. It is recurrence.
- 3. A readiness note.** Where closer relation is being considered, a short note may describe the place and local context, continuity to date, current form of responsibility, ecological and human conditions, purpose of the next step, relevant consent, immediate risks, and whether the truthful next move is continued self-starting practice, closer relation, or limited review.
- 4. A pause, reduction, or withdrawal note.** A pause can be recorded without turning it into failure. The note may state what is changing, whether the reasons concern ecology, human capacity, governance strain, conflict, or external conditions, and what would need to change before renewed activity became truthful.

These surfaces are aids, not gates imposed on every person who uses the public method. Where fuller ecological documentation is needed, use the current PG Ledger guidance. Where a consequential AI-assisted or public claim is made, use the accountability structure of The Correction Loop.

VIII. Pause, withdrawal, and dignified incompleteness

A steward can pause. A steward can withdraw. A person or group can reduce scope, step back from network participation, or remain incomplete without failure.

Honest incompleteness is better than false green. A place honestly at rest is more valuable than a project reporting progress while its stewards are depleting or its agreements are breaking down. Pause is sometimes wisdom. The place may rest. The steward may rest. Continuity matters more than escalation.

Withdrawal from an organisational or network relationship is unconditional where continued participation has become unsafe, unjust, unwanted, or ecologically harmful. This is not merely an emergency clause. It is a design principle. A relationship that cannot be exited safely cannot be trusted.

A difficult season may require a person to reduce attention to minimum care. A field relation may pause during drought, flooding, conflict, illness, or governance strain. A local group may stop its shared rhythm while disagreement is addressed. Gaps should be recorded as context, not concealed as failure.

Dignified incompletion also means that no one owes the network a success story. The honest result may be that an intervention did not work, a relationship did not mature, support was not appropriate, or the place asked for another direction. The ability to say so is evidence of integrity.

Closing note — one day at a time

A person with a bounded place and a notebook can begin without a grant, platform, or institutional affiliation. The practice requires presence, honesty, and the willingness to return. Something larger may develop from that beginning, but nothing should be presumed or forced.

This field guide does not promise transformation. It offers a light structure for care. Whether care changes anything depends on the place, the people, the climate, the season, history, power, resources, and many conditions no protocol can fully anticipate. What the method can protect is the distinction between what was hoped, what was done, what was observed, and what remains unknown.

The decisive question remains: is this giving to life? The question does not remove the need for evidence or disagreement. It gives them an orientation. Answer slowly, return, and remain willing to be corrected — including when the answer is not yet green.

You may begin without being carried. You may grow without being forced. Where deeper relation or support becomes real, it should strengthen the place rather than replace it.

Related public works

This report owns the human journey through beginning, recurrence, relationship, support, and pause. The following public works carry adjacent parts of the architecture:

Knowing From the Ground — situated observation, evidence forms, epistemic limits, and the lineage of Spiralweb's sensing practices.

PG Ledger — the current practical structure for observation, interpretation, consent, data stewardship, and correction.

The Correction Loop — formal accountability for AI-assisted work and named human responsibility.

Sophia Lumen — the relational human–AI working practice and lineage note.

Report 04 — Penguin Dashboard — the three-stream reading and its governance guardrails.

Report 06 — Regenerative Reciprocity — support, value flows, and institutional relationships.

From Ten Square Metres to Planetary Change — the short public account of how Spiralweb works.

Status and field corrections

This is v0.2, July 2026: a working field guide under editorial and practical revision. It does not constitute certification, formal ecological verification, entitlement to organisational support, or a universal development sequence. Its usefulness depends on whether it remains understandable, light enough to use, and open to correction by the people and places affected.

Concrete field corrections are welcomed. Contact: engberg@planetaryguardians.global
