Regenerative Reciprocity

The Relational and Economic Architecture of a Living Commons

Public report · v0.6 · September 2026

Publisher: Spiralweb Papers

Accountable knowledge steward: Lars A. Engberg · CC BY 4.0

Abstract

This report examines how economic flow might be organised around place-bound regenerative relationships. The argument is simple to state and demanding to enact. Regenerative work needs material support, and material support needs a form that does not corrupt what it touches. Many regenerative initiatives do not fail for lack of care or competence; they fail, or remain fragile, because the financial form around them is structurally misaligned with the work. They are funded as projects, compete for short cycles of philanthropic capital, adapt their language to funder priorities, and dry out when the cycle ends.

Regenerative Reciprocity is the economic and relational proposal explored in answer. It is not a fund, grant programme, investment vehicle, adopted policy, or promise of support. It begins with real people and places and asks how support might be documented across three distinct streams: Land and Ecology, Steward Viability, and Governance and Coordination. PG Ledger may assist human observation and memory; it does not decide whether support, pause, expansion, or reciprocity is appropriate. Any such decision remains with the people and legitimate bodies responsible in the actual relationship.

This report does not claim to have solved the problems it names. It claims that an honest economic form is available, that it is specified sufficiently for bounded testing, and that it is worth attempting. It does not ask regenerative fields to become profitable units in a new green economy. It asks whether real people, in real places, can enter a documented relationship of stewardship in which support strengthens life, evidence protects truth, and abundance, when it appears, does not stop at the first successful node.

Function of this report

This report develops a public inquiry into Regenerative Reciprocity: why regenerative work dries out, how three distinct streams and optional PG Ledger formats may make support more legible, and which conditions may help prevent financial relationships from becoming extractive.

A companion *Regenerative Reciprocity — Operational Handbook* is under development to hold worked examples and possible procedures. It is not currently part of the public document set and is not an operative standard. Neither this report nor a future handbook creates authority, funding, membership, contractual obligations, or an operational mandate by publication alone.

The report and handbook form a public document pair. This report carries the slower conceptual argument; the handbook carries more revisable procedural proposals. Governing documents, field-specific agreements, lawful accounting, consent, and decisions by responsible people or bodies retain their own authority. A public paper does not enact them.

Document family and function

Report 06 sits within a wider Spiralweb document family. It does not stand alone, and it is not asked to carry the entire architecture of the work. Locating it accurately matters, because it determines what readers should and should not expect from this single report.

Spiralweb.earth presents current public relationships and status. **Spiralweb Papers** holds versioned inquiry, including this report. Governing documents, field pages, agreements, accounting records, and decisions by a board or other legitimate body retain their specific functions and authority.

Report 06 has a narrower function. It proposes ways to think about support, the distinction among three purpose streams, financial legibility, and possible reciprocity where a field has genuine surplus. Its institutional relevance does not make it a publication or policy of the Spiralweb Stewardship Association. The association is named only where its actual legal role, a designated association publication, or a specific relationship requires it.

Operational summary

Regenerative Reciprocity is Spiralweb's proposed financial architecture for supporting AnchorPoints without turning them into projects, beneficiaries, investment assets, or donor-controlled sites.

The proposal rests on five working commitments. Support begins with a bounded and consent-based relationship rather than an abstract programme. Purpose is read across three streams: Land and Ecology, Steward Viability, and Governance and Coordination. Money may be registered through PG Ledger Format 5 alongside lawful accounting. No colour, score, format, or published paper can authorise intervention, support, expansion, or reciprocity. Where reciprocal circulation is considered, it begins only after locally evidenced surplus and explicit agreement among the responsible parties.

The purpose is not to scale a funding programme quickly. The purpose is to test whether financial support can strengthen living fields without capture, extraction, or hidden human depletion.

Genealogy — where this report stands

This report stands within several converging lineages. From Elinor and Vincent Ostrom's work on polycentric governance and commons institutions, it draws attention to boundaries, locally shaped rules, participation, monitoring, conflict resolution, and nested responsibility. It does not derive an unconditional withdrawal right from that scholarship. Meaningful possibilities to pause, correct, or withdraw must instead be specified within applicable law, consent, agreements, and responsibilities. From the Moral Biology papers, it carries the conviction that economic forms that deplete bodies, relations, or conditions cannot be regenerative. From *Penguin Economics*, it draws the image of capacity moving toward exposed edges rather than accumulating at one centre. From SRIP, understood as a working field guide rather than a master protocol, it carries an invitation to begin with a bounded place, distinguish open practice from deeper relationship, keep three dimensions visible, and ask what the field and the people involved can responsibly hold.

The architecture also follows a biomimetic premise: resilience emerges from diversity, distributed sensing, rotation, and circulation rather than from central command. This principle is operational, not metaphorical. It shapes how flow moves between AnchorPoints, how risk is distributed, and how the centre is kept light enough not to absorb the work the field is doing.

Regenerative Reciprocity also belongs to a wider shift from extractive society toward life-supporting circulation through clear boundaries. The streams, optional field readings, and non-cancellation principle are expressions of this proposition: movement is beneficial only when boundaries, consent, and responsibility remain honest.

Legal and institutional boundaries

One distinction must be clear before the financial architecture can be read accurately, because money requires a legal holder.

Spiralweb names the wider public knowledge habitat and its relationships. **Spiralweb Papers** is the publisher of this report. **Spiralweb Stewardship Association** is a separate legal body with its own governing documents and decision-making. It is not automatically the publisher, institutional home, or legal counterparty for everything published in Spiralweb Papers.

If the association receives or administers a specific flow, its legal role must be established through the relevant decision, agreement, accounting, and compliance process. This report cannot establish that role in advance. It can only make the questions and proposed safeguards visible for later human and institutional consideration.

The integrative contribution of this report

The five PG Ledger formats are published as working and revisable formats. The Constitutional Ground and *Support, Funding, and Patron Pathways* are designated association texts. Report 06 contributes a proposed

financial and relational architecture around them; it does not convert formats, concepts, or examples into association policy. Its task is integrative and exploratory: to connect money with field reality, keep different purposes visible, and identify safeguards that any future lawful implementation would need.

The report does not assume the reader will agree with its specifics. It does assume that the questions it asks are worth asking, and that working answers are needed even where final answers are not yet possible.

1. Where this begins: the AnchorPoint

Spiralweb begins from a recognisable scene. A person stands on a piece of land, or in a school courtyard, or at the edge of a wetland, and something is at stake. The water has dropped. The soil is tired. A child is asking what the world will look like in twenty years. An elder is holding a memory of how the place once was. A farmer has decided not to bore deeper for water and is trying something else. A teacher is wondering whether a school garden can teach more than agriculture. None of this is hypothetical. The work begins where someone has already begun.

This is what an AnchorPoint is. It is not a project. It is not a node in a database. It is not a case study. It is a place where human time, ecological time, and institutional time meet — where a steward, or a small group, has begun to carry something that would otherwise be lost, and where the work they are doing is real enough that it can be observed, supported, and held over time.

1.1 Romance of the Commons

Before the proposal can be set out, it is worth saying clearly what it exists to protect. The previous sections describe what Regenerative Reciprocity refuses: extractive funding, supporter capture, performative reporting, hidden depletion, and project dryout. That refusal is necessary, but it is not the whole story. Streams, formats, and safeguards matter only because something living is being protected.

What is being protected is the possibility that people can fall in love with the commons again. With soil. With water. With species that return when conditions allow. With the children who will inherit the watershed. With the local places that are not abstractions on a map but lived geographies of memory, food, weather, and seasonal rhythm. With the shared life-supporting conditions that no individual can hold alone and that no market can produce. **Commons are not only scarce resources to be managed. They are shared life-supporting conditions to be tended.**

This is not sentimental. It is operational. People who do not love the commons will not protect them through one funding cycle, let alone through the multi-decadal time required for ecological repair. Stewards who carry a piece of land for twenty years do not do it because the project plan said so. They do it because something has happened to them — a relationship has formed with a place that has become irreversible. The work survives because of that relationship, not because of the funding around it.

But love for the commons needs a form. Without ledger, governance, boundaries, and honest accounting, love can become fog, burnout, or hidden extraction. People who love a place can quietly destroy themselves carrying it. People who love a movement can quietly absorb its surplus into their own livelihoods without intending to. People who love an idea can quietly substitute the idea for the real conditions under which it would have to be enacted. Love without form does not save anything; it loses itself. And without love, ledger becomes dead bureaucracy. A field documented only because the funder requires documentation produces statistics, not stewardship.

Regenerative Reciprocity begins from the possibility that people can fall in love with the commons again — with soil, water, species, children, local places, and shared futures — and that such love needs a financial form that does not destroy it.

This is the underlying claim of the proposal. The streams are not bureaucratic categories; they are ways of keeping different forms of care visible. A person must be able to say "this is too much" without a dashboard speaking over them. The non-cancellation principle protects people and places from being silently consumed by the metrics around them. Reciprocity begins as a question about whether a field can contribute without weakening itself, not as a percentage or automatic expectation.

The mature formulation, which this report holds throughout, is brief: **romance without ledger can become fog. Ledger without romance can become dead bureaucracy. Together they can become stewardship.** Neither is sufficient on its own. The architecture proposed in this report is the attempt to keep both legible at once.

It also follows from this that **before financial architecture acts, it must pause long enough to read the field. Regenerative Reciprocity begins not with design, but with attention.** A funder who treats a prior plan as authoritative before the field can answer and correct it has begun extraction. A provisional position may be disclosed to make assumptions visible; it becomes legitimate only through response and correction. A protocol that imposes its rhythm before the place has revealed its own has already begun displacement. The architecture in this report is calibrated to slow down at the point of entry, to listen before allocating, and to allow the field to set the pace of its own legibility.

What follows in the rest of this section is the architecture's grounding in actual people and places. It is set out plainly, but the reader should hold the underlying principle: every form below — every stream, every band, every protocol — exists because something living is being protected, and because the form is what allows the love to remain real over time.

1.2 The AnchorPoint is relational, not administrative

The AnchorPoint is defined first by relationship and second by geography. A piece of land alone is not an AnchorPoint. A funded project alone is not an AnchorPoint. What makes a place an AnchorPoint is the presence of a person — or, more often, a small group — who is in steady relationship with the place, who knows it across seasons, who can read what is changing, and who carries the work without needing constant external direction. The AnchorPoint contact is not an administrator. They are a human bridge between the lived reality of a place and the wider architecture that hopes to support it.

This matters because it determines what kind of support is possible. A project can be funded. A relationship can only be carried. The economic architecture in this report is built for the second case.

It also follows that **local authority does not mean isolation. Each place remains rooted in its own rhythm, context, people, and ecological reality.** Entering a relationship with Spiralweb does not transfer authority. Shared infrastructure, peer relationship, documentation, or material support exists only where actually agreed. The field's own knowledge remains indispensable, while local decisions must also respect the rights, laws, agreements, and responsibilities that apply.

1.3 Situated scales of practice and relationship

Spiralweb can be used across different scales of practice and relationship. These are neither a hierarchy nor a universal sequence, and no scale automatically confers authority, recognition, membership, or entitlement to support.

A **10 m² practice** can be a useful invitation to begin with a bounded place that a person can actually observe and tend. It is an optional inquiry tool, not a universal unit, threshold, or minimum. A person may begin at another appropriate scale, and a small practice may remain small and independent.

A **steward** is a person or group in continuing relationship with a practice or place. The word describes responsibility and attention; it does not by itself define an institutional role.

A **Circle of 13** is one possible form for shared learning or coordination. Thirteen may be generative in some contexts, but the number is not inherently representative and does not create governance legitimacy. Groups must shape participation and decision-making according to their people, place, consent, and actual mandate.

An **AnchorPoint** is a situated relationship around a place or practice that has enough continuity to be described publicly and, where explicitly agreed, to carry shared work. It is not the compulsory next step after a circle, and it may grow from many different relational forms. Its status depends on the actual relationship and on people's capacity to pause, correct, or withdraw within the agreements that apply.

A **bioregion** is one possible horizon for cooperation among places connected by ecological and cultural conditions. It is neither the largest nor the final scale. Practice may remain individual, local, networked, bioregional, or connected across other forms without being treated as incomplete.

1.4 The current Spiralweb field relationships

Spiralweb's public field pages provide the current account of field relationships and their status. Because relationships change, this report does not freeze a portfolio, maturity ranking, or partnership claim into a versioned economic proposal. Examples used below are illustrative and must be read against the current field pages before any conclusion about an actual relationship is drawn.

Places are not interchangeable. Each field relationship carries its own ecological, cultural, governance, and economic conditions, and any use of the proposal must support that difference rather than standardise it.

Local stewards are not identified by name in this public report. **Consent is not a one-time checkbox. It is an ongoing field condition.** Field participation, use of images, publication, naming, support flows, and partnership

status must all remain revisable. In public materials, names, photographs, school identities, precise locations, and personal circumstances are omitted or generalised unless explicit and current permission makes their inclusion necessary and appropriate. This is especially important where children, schools, land tenure, political vulnerability, or economic hardship are involved. Documentation must not become a form of exposure. Visibility is in service of the field, not in service of the report.

Food, soil, and water across these fields are not only outputs, inputs, or indicators. They are **living relationships** through which stewardship becomes visible. A water condition in Doukkala is not a number; it is a question about how rain, soil, reservoirs, trees, animals, and steward judgement meet in one place. A school garden contemplated in Karachi is not merely a deliverable; it would be a place where children could learn that something can grow under their care. The architecture must remain compatible with this relational reality, not displace it.

1.5 How the relation actually becomes real

The architecture described in the rest of this report — formats, streams, bands, protocols, agreements — only matters because something has happened first that none of those forms can produce. A relation has begun. It is worth describing that beginning honestly, because the entire architecture rests on it.

Consider how an AnchorPoint relation actually forms. Someone stands on a piece of land somewhere in the world. A steward in Doukkala, perhaps. They say something like: *the land must be read before planting expands; water, soil, animals, trees, and people have to be understood together*. There is land. There is risk. It is not a project. It is their life. Someone listens. They promise nothing. They take it in. That is the first relation, and it has nothing yet to do with money.

Later, perhaps in another country, that same listener sits with another person — not a donor, not a target, just a person. They do not say "we have a project" or "we need support." They say something more precise: *I was somewhere in Morocco. I met a man who is trying to keep his land alive without destroying it. I cannot let it go*. And then they wait. If the person across from them feels nothing, nothing happens, and that is acceptable. If they feel something, they ask: *what are you doing about it?* The answer, when it is honest, is not a pitch: *I am not trying to solve it. I am trying to keep the connection open. And to make it possible for that work to continue without being taken over*.

It is only at this point — after the relation has been established, after a real person has been brought into the room, after the listener has decided not to turn away — that economy can be mentioned without distorting what has just happened. The sentence is brief: *it takes time and resources to keep being in this. I cannot carry it alone*. Then silence. Not "will you support?" Not "can you help?" Only the truth.

If the relation is real, the other person moves on their own: *what does that mean concretely?* The answer, again, is plain: *that I can keep going there. That we can document what actually works. That this does not become another project that disappears*. The decision then takes one of two forms — *I would like to be part of this* or *I cannot right now* — and both are correct. The point is not which answer comes. The point is that nothing was extracted to produce it. The economy emerged as a consequence of relation, not as a condition for it.

This is one way an AnchorPoint relation may begin between human beings. Without a relational layer, the rest of the proposal becomes administrative. Formats, agreements, and financial procedures may support a

relationship; they cannot produce or substitute for it.

This has an editorial consequence for public field pages. They should present people and places with consent, context, and enough evidence to be corrected. They should not turn vulnerability into a fundraising device. Data, narrative, images, and invitations must remain proportionate to the real relationship and revisable by those represented.

1.6 The decisive question

Behind every observation, every transfer, every protocol decision in this architecture sits the same question that SRIP places at the centre of stewardship practice: *is this giving to life, or is it taking from life?* The question applies not only to land practice but to the financial form around it. A transfer that strengthens steward viability, supports ecological repair, and clarifies governance is giving to life. A transfer that creates pressure, distorts local decision-making, or generates obligation that displaces stewardship is taking from life. The architecture proposed in the rest of this report is calibrated to the first and designed to refuse the second.

This is not a slogan. It is a question that can orient human judgment without replacing it. Section 8 returns to the safeguards. Possible procedures and legal classifications require further work and do not become operative merely by being drafted or published.

1.7 What the rest of the report is for

The rest of this report describes how money can enter, move through, and where appropriate return from this network of AnchorPoints without distorting them. The principle is simple. Where a real person, in a real place, has begun real work, support should be able to reach them in a form that strengthens the work without taking it over. The form of that support is what this report sets out.

2. The structural problem: why regenerative initiatives dry out

Many regenerative initiatives do not fail because the people involved lack care or competence. They fail, or remain fragile, because the financial form around them is structurally misaligned with the work. Understanding this is a precondition for understanding why Regenerative Reciprocity exists.

2.1 The project-cycle pattern

The dominant pattern in regenerative funding is project-based. A local initiative identifies a need. It writes an application. It competes against other initiatives for a finite philanthropic or grant pool. If successful, it receives temporary support — twelve months, twenty-four months, occasionally thirty-six. It adapts its language to the funder's priorities, often subtly reshaping what it actually does. It produces reports against indicators chosen by external evaluators. The funding cycle ends. It must compete again for the next round, often re-justifying the same work in new terms to a new funder.

This pattern produces five predictable outcomes. The first is **scarcity-driven competition**: regenerative actors who should be collaborators become rivals for the same pool of money. The second is **strategic mimicry**: each initiative learns to speak the language of funders rather than the language of its own soil, water, and community. The third is **fragmentation**: the work splits into discrete projects with formal start and end dates, even when the underlying ecological and social work is continuous and multi-decadal. The fourth is **performative reporting**: indicators and metrics are produced because they are required, regardless of whether they match what is actually happening on the ground. The fifth is **dryout**: when funding ends, the field is left to compete again, and many simply stop.

The deeper problem behind these five outcomes is a category mistake. **Regeneration is not primarily a project category. It is a sustained posture of tending, observation, repair, and long-horizon responsibility.** Project-cycle funding can support some of this work some of the time, but it cannot produce the underlying posture. Where the funding form treats regenerative work as if it were a series of bounded projects, the work itself begins to fragment to fit the form. The form wins; the work loses.

2.2 What a field actually needs

A regenerative field does not only need money. Treating money as the primary organising input is itself part of the problem. A field needs continuity over multi-year horizons; local trust between people who can carry decisions together; steward viability so that the people doing the work can live; ecological observation that is honest rather than promotional; governance clarity so that decisions are documented and conflicts can be addressed; documentation that records what is actually happening; basic infrastructure such as tools, transport, and meeting space; the dignified possibility of pause and withdrawal when life requires it; the capacity to receive support without being distorted by it; and, eventually, the capacity to return capacity outward without being extracted.

Money supports several of these, but it does not produce any of them. Money badly placed actively destroys some — particularly trust, viability, and honest observation. The design problem is therefore not how to bring more money into regenerative work. The design problem is this: how can money enter living fields without becoming sovereign over them?

2.3 What Spiralweb proposes instead

Spiralweb's answer is not simply "more funding." This report explores a relational and economic architecture in which a project may be held within a longer relationship, documentation may support human judgment, recipients retain agency, and supporters do not purchase control. These shifts require choices that must be tested in actual relationships rather than declared complete on paper.

A possible sequence is straightforward to describe. A real person and place are recognised. A bounded practice begins or is already underway. Participants choose what documentation is useful and proportionate. Three streams may be considered separately: land and ecology, steward viability, governance and coordination. Any support is explicitly agreed, lawfully classified, and limited to what the relationship can carry. If genuine surplus later exists, the responsible parties may consider an outward contribution. None of these steps follows automatically from a status, score, or document.

Philanthropy in this model does not "complete" a project. It enters a living pattern and helps it become reciprocal. That is the difference, and the rest of the report is the working-out of what that difference requires.

3. The Spiralweb ground

Before describing what Regenerative Reciprocity adds, this section sets out what Spiralweb already has in place. The architecture proposed in this report does not begin from zero; it extends an existing body of work that includes the AnchorPoint structure, the PG Ledger formats, the three-stream separation, and the SRIP (Steward Regenerative Integration Protocol) framework.

3.1 The five PG Ledger formats

PG Ledger is not a single document, database, decision-maker, or source of truth. It is a set of five working formats that can help people observe, remember, compare, and discuss different dimensions of a field without collapsing them into one score. The formats are downloadable from papers.spiralweb.earth/formats and may be printed, adapted, translated, combined, or left unused according to local purpose and consent.

Format 1 — Steward Monthly Dashboard. A one-page human reading across the three streams (Land and Ecology, Steward Viability, Coordination and Governance). If colour language is useful, it can make a concern or question visible. It does not produce an operational status or govern decisions about support, expansion, pause, or reciprocity.

Format 2 — Observation Sheet. A field-use record for situated observations such as soil cover, vegetation, water behaviour, succession, biodiversity, biomass, and human rhythm. The categories are prompts, not a universal minimum, and may be adapted to the ecology, knowledge traditions, skills, and risks of the place.

Format 3 — 30-Day Action Sheet. An optional coordination record naming what people have agreed to do, who carries it, and what is deliberately not being done. A colour reading may invite a conversation about reducing activity; it cannot authorise that reduction by itself.

Format 4 — Governance and Decision Log. An optional record of decisions, the conditions under which they were made, who took part, and how they may be revisited. The log preserves memory; it does not confer mandate or make decisions.

Format 5 — Financial Ledger. A one-page financial record that connects what entered or was spent with its stated legal classification, purpose stream, and subsequent observations. Format 5 is a field-legibility aid for money. It does not replace the formal bookkeeping, bank reconciliation, receipts, or statutory reporting of whichever legal person or organisation is responsible.

3.2 The three streams that the formats register

Behind the five formats sit the three streams that Spiralweb's governance architecture has held since Report 03 and that SRIP names explicitly. The streams are not the formats. The formats are the operational surfaces; the

streams are the dimensions of reality the formats are designed to make legible.

Stream A — Land and Ecology. What is happening on the land: soil, water, biodiversity, succession, biomass, food, habitat, field resilience. Read primarily through Format 2 (Observation Sheet) and synthesised in Format 1 (Monthly Dashboard).

Stream B — Steward Viability. What is happening to the people carrying the field: energy, pressure, capacity, presence, fatigue, livelihood. Read primarily through the steward-condition section of Format 1 and through the human-rhythm category of Format 2.

Stream C — Coordination and Governance. What is happening in the relational and institutional structure that holds the field together: agreements, decisions, roles, conflict resolution, external relationships. Read primarily through Format 4 (Decision Log) and synthesised in Format 1.

3.3 The three-stream non-cancellation rule

The streams are analytically distinct. Strength in one should not be used to hide distress in another. Ecological progress does not cancel human depletion; clean documentation does not cancel ecological decline; and a compelling narrative does not replace situated observation. What follows from these observations remains a human decision made with the people affected and within the mandate that applies.

This non-cancellation principle helps prevent ecological success from masking human burnout, governance neatness from masking ecological decline, and narrative coherence from masking either. The Penguin Dashboard is a human reading surface for holding such tensions in view; it is not a score machine, truth machine, database, or governor.

A yellow or red reading is therefore an invitation to inquire, not an instruction to intervene. It may lead people to pause, reduce, continue, seek help, or interpret the situation differently. The reading itself authorises none of these. The protective principle is that ecological ambition must not be financed by human depletion, while decisions remain situated, consent-based, and accountable.

3.4 The three financial streams

The same three-stream architecture organises financial purpose. When support enters the system, each Format 5 entry carries two classifications that answer different questions: **which purpose stream does this serve?** and **what kind of transaction is it?** The first is Stream A, B, or C. The second may be compensation, salary, honorarium or service payment; conditions and protection; reimbursement; procurement and materials; or living-field investment. Purpose and payment form remain separately visible.

Financial Stream A — Land and Ecology funding supports the living place and ecological work: trees, seeds, soil work, water retention, tools, nursery development, compost systems, ecological monitoring, and local ecological training. Where people are paid to carry this work, their compensation or service payment remains visibly classified as such within Stream A.

Financial Stream B — Steward Viability funding supports the conditions and protected capacity that allow people to carry the field: rest, health and social protection, continuity, protected learning and formation, actual expenses where their purpose is viability, and, where agreed, a livelihood buffer during transition. It is not a

general wage bucket. The Constitutional Ground document is explicit on this: land cannot be healed through hidden human depletion, and ecological ambition must not be financed by human burnout.

Financial Stream C — Governance and Coordination funding supports the institutional and relational infrastructure that holds the field together: AnchorPoint coordination, monthly review, PG Ledger logging, accounting and receipts, evidence storage, local meeting costs, legal and compliance support, reporting, and translation into shared protocols. Paid work and services carried for these purposes remain visibly classified as compensation or service payments within Stream C.

A person may carry work across more than one stream. Every transfer therefore records both its purpose stream and its lawful payment or accounting type. Human work is never made unpaid by stream classification, and Stream B is never used to conceal where paid land, coordination, research, hosting, documentation, or translation work actually belongs.

The rule is the same as for the observation streams: a donor must not fund Financial Stream A while Stream B quietly burns out. A field must not show Stream A progress while Stream C becomes opaque. A local surplus must not be extracted while the people holding the field are unstable. Each stream is read separately, supported separately, and reported separately, without silent substitution between them.

3.5 What is in place and what remains to be tested

The five PG Ledger formats are documented and downloadable. AnchorPoints, the three-stream distinction, SRIP, and the Penguin Dashboard are public working concepts and tools. The Constitutional Ground and *Support, Funding, and Patron Pathways* provide designated association texts where their specific institutional scope applies. Reports 01–05 contribute earlier inquiry; they do not collectively constitute an adopted operational framework.

Report 06 adds a proposal for connecting financial records with field observation and for discussing possible reciprocal circulation. Format 5 is already published, so the task is no longer to announce a missing format but to clarify its limited role and the questions that remain untested.

4. The financial layer: Format 5 — Financial Ledger

The first four PG Ledger formats offer different reading and memory surfaces: a monthly dashboard, situated observation, a short action horizon, and a decision log. Format 5 adds a financial record that can connect a transaction with its stated purpose and observed effect. None of the formats contains the whole reality of a field, and none replaces conversation, consent, expertise, formal accounting, or legitimate governance.

The purpose of Format 5 is to reduce the gap between financial records and lived effects. It does not claim that every effect can be attributed to a payment or that an observational note proves causation. It simply keeps the two close enough for people to ask better questions.

This report introduced a fifth operational format to close that gap. The Financial Ledger is now published alongside Formats 1–4.

4.1 Format 5 — Financial Ledger

Format 5 is the fifth PG Ledger format. It is not formal accounting, a KPI dashboard, or evidence that a payment caused a particular outcome. It is a one-page working record of what came in, what was spent, for what stated purpose, and what participants subsequently observed.

A single entry in Format 5 is light. At minimum it records the date, the amount, the currency, the legal classification (donation, grant, membership, service payment, salary, reimbursement, reciprocity contribution), the recipient, the financial stream (A, B, or C), the purpose, and a short note linking the spend to the field reality it produced.

A worked example: rather than the entry "*expense: 1,200 DKK*", Format 5 records "*12 May 2026 — 1,200 DKK — Stream A — water pipe — installed at northern edge of plot, functioning, reduced manual carrying during field days.*" This is light. It is one line. It connects money to action to lived effect. It makes the money-to-life link traceable without bureaucratising it.

A useful Format 5 entry may contain: date; amount; currency; exchange rate where relevant; source category; recipient; legal classification; purpose stream; purpose; transfer method; receipt or evidence reference where available; a carefully framed observation; privacy or consent notes; and an appropriate review trace. The necessary fields and review thresholds depend on purpose, risk, law, and the responsible organisation. Format 5 remains an optional operational ledger, not the formal accounting record.

Format 5 is published alongside Formats 1–4 at papers.spiralweb.earth/formats. Its fields, examples, and reporting burden remain subject to revision as the first AnchorPoints test it in operation.

4.2 What Format 5 prevents

Format 5 is designed to help people notice three recurring risks in regenerative finance.

The first is **opacity**. When financial records and field observation remain entirely separate, participants may struggle to connect spending with stated purpose and lived effect. Format 5 can be read alongside whichever other records are useful, by the people who are authorised to see them.

The second is **abstraction**. Formal accounting necessarily records transactions, but often does not carry the full context of what followed. Format 5 invites a note about what was bought and what participants observed afterwards. The note supports inquiry; it is not proof of causation.

The third is **disconnection**. When money and observation never meet, it becomes harder to ask whether spending matched purpose and what else shaped the outcome. Format 5 keeps those questions available without claiming to answer them alone.

4.3 Format 5 and formal accounting: a clean distinction

Format 5 does not replace formal accounting. Each responsible person or organisation must maintain the books, reconciliation, reporting, and legal compliance that apply to it. Format 5 is not the legal record; it is an optional operational record alongside formal accounting.

The clean formulation is this: **Format 5 is a field-legibility aid. Formal accounting remains with the responsible legal person or organisation.** Where the association is a party, that includes its bookkeeping, bank reconciliation, receipts, annual reporting, and applicable policies. Format 5 connects money with stated purpose and observation; it does not replace the legal accounting record.

This distinction is essential for bankability. A bank, funder, recipient, or auditor must be able to identify the actual legal counterparty and formal accounting record. If the association is that counterparty, the record sits in its ordinary bookkeeping and applicable governance framework. If another party is responsible, its lawful system applies. Format 5 may sit alongside either, but it does not determine responsibility.

Format 5 also does not replace any actual AnchorPoint agreement, grant terms, service contract, or country-specific legal documentation. It is a registration format, not a contractual document. It records part of what happened; an agreement specifies what the parties have undertaken.

4.4 The five formats together

Taken together, PG Ledger's five working surfaces can support a partial reading of a field:

1. **Format 1 — Monthly Dashboard.** Supports a human reading across the three streams; colour terms remain prompts, not status decisions.
2. **Format 2 — Observation Sheet.** Holds situated observations through locally adapted prompts.
3. **Format 3 — 30-Day Action Sheet.** Names what will be done and what will not.
4. **Format 4 — Decision Log.** Preserves a trace of decisions and their conditions.
5. **Format 5 — Financial Ledger.** Registers money in the same observational mode as the others.

No combination of formats produces an authoritative field status or establishes that surplus exists. The people responsible must interpret the record, include knowledge that the formats miss, and decide within their actual mandate. A relationship may use all five formats, some of them, adapted versions, or another appropriate documentation practice.

Format 5 can be a financial field-legibility aid. The proposal does not depend on universal adoption of the format.

5. The three streams in operation

Section 3.3 introduced the three streams as a constitutional principle. This section describes how they operate financially. The principle is simple: every payment, receipt, and allocation records both its purpose stream and its transaction type, and no apparent strength in one stream is allowed to cancel deterioration in another.

5.1 Stream allocation

When support enters the system, the bounded field budget determines what is required across all three streams. Donor intent or legal restrictions may designate the purpose of a contribution, but they do not make an underfunded scope viable. A field cycle activates only when the necessary streams and the full bounded commitment are funded and reserved. If that condition is not met, the scope is reduced or the start waits; the unfunded work is not silently absorbed by stewards.

The allocation is not concealed. Format 5 records the purpose stream and, separately, the transaction type. The recipient knows how each transfer is classified and reports against it accordingly.

5.2 No silent cross-stream substitution

The three-stream separation is enforced by accounting practice, not just by intent. If a Stream A allocation is underspent because trees and tools cost less than expected, the residual does not automatically transfer to Stream B to cover steward costs. The residual is held, the underspend is documented, and a deliberate decision is made about whether to extend the Stream A work, return the residual to the AnchorPoint reserve, or — only with explicit governance approval and donor-side acceptance — reallocate.

This is operationally less convenient than blended budgets. It is also what prevents the most common failure mode in regenerative finance, in which Stream A appears successful because it absorbed funding intended for Stream B, while the steward quietly carries the unfunded burden.

5.3 What Stream B supports

Stream B requires its own subsection because steward viability is what regenerative initiatives most often fail to fund explicitly. Stream B is not "overhead." It is not "administration." It supports the conditions that allow people carrying the work to live, rest, learn, and continue.

A Stream B budget may include protected learning and formation, rest and continuity, health or social protections, livelihood-transition support, and reimbursements whose purpose is steward viability. It is not the general container for all payments to people. Compensation for ecological work belongs by purpose in Stream A; compensation for governance and coordination work belongs by purpose in Stream C; work carried for Stream B remains in Stream B. In every case, the transaction type remains separately visible.

Any compensated human work, regardless of purpose stream, is calibrated within the relevant national and field-area frame. Applicable law, locally relevant professional comparators, working conditions, living-wage evidence, actual time and responsibility, and correction by each person carrying the work are considered together. Living-cost evidence is an input, not the target by itself. The aim is stewardship compensation that is locally attractive and professionally recognisable without exporting Danish or international salaries. Publication

of a method or a figure does not create a rate, offer or entitlement; only a funded, lawful and bounded field agreement can do that.

Two principles sit beneath Stream B and govern how the whole field budget is read. The first concerns rest: **rest is not a reward for productive fields; it is part of field viability. Burnout is not evidence of commitment. It is evidence that a boundary has failed.** A budget that funds activity but not rest is funding eventual collapse. The second concerns what a budget can and cannot legitimately cost: **no budget should be considered viable if it depends on the loss of human breath — chronic stress, unpaid overload, or the collapse of steward capacity.** If meeting the field's stated outputs requires extracting from the steward's body or life, the outputs must be reduced, not the steward.

5.4 What Stream C supports

Stream C concerns the relational and institutional infrastructure that may hold specific work together: coordination, agreed review, proportionate documentation, accounting and receipts, evidence storage, local meetings, legal and compliance support, and communication among the parties. The necessary elements depend on the actual relationship; neither all five formats nor reporting to the association is presumed. Where people carry this work, compensation or service payment remains visible as the transaction type within Stream C.

Coordination needs may change over time. Early agreement-making, legal review, and documentation setup can be intensive, while later continuation may become lighter or reveal different needs. Any future phase examples should be treated as planning prompts, not universal maturity states.

5.5 The fourth movement: reciprocity

The three streams describe purposes that may need to remain visible when support enters a field. Regenerative Reciprocity adds a possible fourth movement: when genuine surplus exists and the responsible parties agree, capacity may move back or outward.

Section 7 describes this inquiry in full. Ecological output must not be used to justify reciprocity while people are depleted or governance is unable to carry the decision. The conclusion is reached through human judgment and agreement, not by a field status.

6. Regenerative Reciprocity: definition and rule

Regenerative Reciprocity is the central proposal of this report. This section defines it clearly, sets out what it is not, and states the rule that governs it.

6.1 Definition

Regenerative Reciprocity is the calibrated return and outward circulation of capacity from an AnchorPoint that has become stronger through shared support, without creating debt, extraction, ownership, or control.

It rests on a single observation. A regenerative field that has been carried by others may, when it becomes strong enough and the responsible parties freely agree, contribute outward. This is not repayment, investor return, profit-sharing, or supporter reward. Earlier support does not purchase recognition, status, ownership, or future control.

It is, instead, the continuation of a flow that was begun by others. When a field has stabilised and produces real net surplus, a calibrated portion of that surplus circulates: back to the shared infrastructure that made the field's documentation, governance, and support possible; outward to other AnchorPoints that are still in their fragile early years; and into bioregional pools that carry capacity across the network. The point is not to return what was given. The point is to prevent flow from stopping.

6.2 What it is not

Regenerative Reciprocity is not loan repayment. It is not investor return. It is not profit-sharing. It is not a donor reward programme. It is not a franchise fee. It is not a tax on the field. It is not centralised redistribution. It is not an obligation triggered before viability.

It is also not philanthropic recycling in the sense that grants sometimes operate, where a foundation requires its grantees to fund peer organisations as a condition of receiving the grant. Regenerative Reciprocity is voluntary, calibrated, and never activated against a field's own viability.

6.3 What it is

Regenerative Reciprocity is the acknowledgement of received support without the structure of debt. It is the protection of the network against one-way dependency. It is contribution to shared infrastructure by those who have benefited from it. It is peer-to-peer field support across AnchorPoints. It is bioregional circulation. It is commons replenishment. It is gratitude made operational rather than rhetorical.

6.4 The rule

The rule that governs Regenerative Reciprocity is simple and absolute:

When abundance emerges, flow continues. When fragility is present, fragility is protected.

Colour language does not trigger or prohibit reciprocity. The question may arise only when the people responsible have evidence that local wages, field costs, ecological reinvestment, steward viability, reserves, and local obligations are securely met. Even then, reciprocity requires a separate, explicit, lawful, and revisable agreement. It is never presumed from receiving support and is never calculated automatically.

Earlier drafts explored fixed percentage bands. This edition withdraws them as active guidance because no common percentage has been validated across the different fields, economies, legal settings, and time horizons involved. A suitable contribution may be financial, non-financial, deferred, or absent. If there is doubt about whether surplus is real, the doubt protects the field.

6.5 Neither market nor pure gift

It is worth naming clearly what kind of economic form Regenerative Reciprocity is, because it is easy to mistake it for something it is not.

It is not a market form. In a market form, the relation is reduced to transaction; value is measured in price; and what cannot be priced disappears. Regenerative Reciprocity does not reduce a field to its yields, does not price a steward's care, and does not treat the AnchorPoint as a unit of production. The relation is primary; the economy is a consequence.

It is not a pure gift economy either. In a pure gift form, economic clarity is treated as suspicious, and someone usually ends up paying the hidden price — most often the people closest to the work. Spiralweb's Constitutional Ground is explicit on this: land cannot be healed through hidden human depletion, and ecological ambition must not be financed by human burnout. A purely gift-based form would protect the rhetoric of non-extraction while quietly producing extraction in practice. Regenerative Reciprocity refuses that trade.

What Regenerative Reciprocity proposes is a third form. The relation is primary. The economy is secondary, but explicit. Money is necessary, and that is said clearly. Money does not buy control. The field's existence does not depend on any single transaction. The steward is not expected to subsidise the architecture's purity with their own life. None of these can fail without the form collapsing back into either market dominance or hidden self-exploitation.

One further clarification follows from this third form. **Regenerative Reciprocity does not abolish contracts or accounting. It prevents contracts and accounting from becoming the whole relationship.** Banks, associations, supporters, and recipients require appropriate documentation. This proposal does not weaken those duties. It refuses only the reduction of the entire relationship to its contractual and accounting layers. The contract holds a legal form; the relationship carries dimensions that the contract cannot contain. Both matter, and neither substitutes for the other.

This third form is not standardised. It is being designed in practice across the AnchorPoints described in this report. The architecture is provisional. What is non-negotiable is the structural commitment: a relation can carry money without becoming a market, and an economy can be honest without becoming extractive. Whether that commitment can be sustained over time is the open question this report does not pretend to have answered.

7. Reading readiness without automating decisions

Earlier versions organised reciprocity through red, yellow, green, and deep-green phases with corresponding percentage bands. Those devices can make questions visible, but they overstate what a shared format can know and risk turning a human reading into an automatic rule. This edition therefore treats colour and phase language only as optional prompts.

7.1 A red reading is a signal, not an instruction

A red reading may indicate ecological stress, human depletion, unclear governance, shock, conflict, or simply that participants need to stop and understand what is happening. It does not by itself authorise intervention, stop work, redirect money, demand evidence, or change a relationship. Those choices require human conversation, consent, relevant expertise, and legitimate authority.

7.2 Yellow, green, and deep green are provisional descriptions

Yellow may help name uncertainty or instability. Green may help name a presently workable condition. Deep green may help people discuss sustained abundance. None is a certification, performance score, contractual state, or claim that a whole field has one colour. Different people may reasonably read the same situation differently, and important realities may sit outside the formats.

The central safeguard remains: **growth cannot be commanded by funding**. Expansion, pause, and support must follow the carrying capacity of the people, place, agreements, and responsible institutions involved. A funder cannot purchase maturity, and a dashboard cannot declare it.

7.3 Establishing whether surplus is real

Net regenerative surplus is a question before it is a number. It asks whether the following are securely met without hidden depletion:

1. Lawful and fair compensation and viable livelihoods
2. Field operating costs and existing obligations
3. Necessary reinvestment in soil, water, biodiversity, and infrastructure
4. Prudent reserves appropriate to the local risks and organisation
5. Capacity for illness, care, transition, and unforeseen conditions

No universal reserve percentage or reciprocity band is proposed. Local accounts, Format 5 where useful, observations of ecological condition, and direct correction by the people carrying the work may all inform the inquiry. They do not replace professional financial advice, contractual agreement, or a decision by the body authorised to make it.

7.4 Reciprocity requires a new agreement

Receiving support does not create a future debt. If participants later wish to circulate financial or non-financial capacity outward, they make a new agreement based on the circumstances then present. The amount, form, destination, timing, ability to pause, and responsibility for the decision must be explicit. No contribution is inferred from colour, duration, gratitude, affiliation, or earlier support.

8. Conditions that keep the architecture non-extractive

The proposal remains regenerative only if future operational forms do not reproduce capture, exposure, hidden obligation, or an increasingly heavy centre. The conditions below are safeguards for further inquiry. Any procedural expression requires separate development, testing, and legitimate adoption.

8.1 The central design rule

The single most important design rule is this: **the system must be hard to exploit and easy to be truthful in.** Every guardrail is evaluated against that test. A guardrail that makes exploitation harder but also makes honesty harder is the wrong guardrail. A guardrail that makes honesty easier without making exploitation easier is the right guardrail.

No design can prevent all dishonesty, error, misalignment, or manipulation. No defensible loss percentage is known in advance, and guardrails cannot make large exploitation impossible. Their purpose is more modest: reduce incentives for distortion, make concerns easier to raise, preserve an auditable record where appropriate, and keep correction possible.

8.2 Documentation must not become exposure

One principle deserves its own subsection because it cuts across every operational layer: **documentation must not become exposure.**

PG Ledger is a documentation architecture. AnchorPoint pages are documentation surfaces. Format 5 entries link money to field reality. Photographs, names, school identities, soil data, water observations, governance decisions, and steward reflections all enter the ledger over time. The architecture's strength is precisely this legibility. But the same legibility, deployed without care, can become a form of harm.

Visibility is only legitimate when it serves the field and is consent-based, proportionate, contextual, and reversible. Images, names, school identities, precise locations, economic vulnerability, land tenure, political sensitivity, and children require particular care. A photograph that helps a foundation understand the work may also expose participants to attention they did not consent to. A name that builds relational warmth in a public report may also place a steward in a position they cannot easily withdraw from. A precise location useful for protocol replication may also expose land tenure that is contested. The default is restraint. The exception, when documentation moves from internal record to public visibility, requires explicit and current consent — not the consent given two years ago at the moment of first relationship, but the consent that holds today, for this particular use.

Field pages should be truth surfaces, not campaign surfaces. The distinction matters. A truth surface records what is real, with the participants' active consent, in a form they themselves can read and correct. A campaign surface deploys the field's reality in service of an external goal — fundraising, profile-building, political advocacy — that may or may not align with what the field itself needs. The two can look identical from outside. They are not the same thing.

This principle connects directly back to consent as ongoing condition (Section 1.4). Consent given is not consent owned. A steward, a school, a Circle of 13, or an AnchorPoint may at any time withdraw permission for

further use of images, names, or specific information, and the architecture must be able to honour that withdrawal in practice — not just in policy. Where the association cannot guarantee removal across all downstream uses (third-party publications, partner reports, archived materials), it must say so plainly at the point of original consent, and calibrate what is published accordingly.

8.3 The cultural layer

The deepest guardrail is cultural. Without it, the structural and behavioural layers fail.

The cultural rule is: **a steward must never have to choose between honesty and survival**. If the system produces that choice, stewards will choose survival, and the architecture collapses. The system must therefore make honesty rationally safer than performance.

This requires several things from Spiralweb itself, not from stewards:

- **Allowing institutional uncertainty to be visible.** Where the association or another body is actually responsible, it should be able to acknowledge difficulty without performing certainty.
- **Not rewarding "perfect green."** Colour readings must not create prizes, rank, status, or enhanced visibility.
- **Sharing learning only with consent.** A difficult period may become a learning account where participants choose this and risks have been considered.
- **Never using red as implicit criticism.** A red reading is a prompt for attention, not a verdict.

This is the layer that determines whether the rest of the proposal can work. Structural and behavioural safeguards can be specified; culture must be lived by the people and organisations that actually enter a relationship.

A further cultural principle holds throughout this layer: **a regenerative financial system must be kind without becoming vague. It must leave room for pause, correction, role flexibility, and learning without dissolving accountability**. Grace and rigour are not opposites in this architecture; they are the two sides of the same form. A system that becomes rigid in the name of accountability loses the field; a system that becomes vague in the name of kindness loses the discipline that makes care durable. The work is to hold both at once, in the same conversation, often in the same sentence.

Underlying all of this is a definition of governance: **governance is not control over a field, but an accountable arrangement of roles, evidence, care, responsibility, and decision-making**. A board, local group, agreement party, or supporter may carry a role only where that role has actually been established. This report does not assign governance standing to any person, format, circle, or supporter.

8.4 The hard truth

Several things will happen regardless of how well the guardrails are designed:

- Some people will perform.
- Some will exaggerate.

- Some will fall away.
- Some will misuse small amounts.
- Some will hide problems.

These are not failures of the system. They are the system's tests. The architecture passes when small misuse remains small, when honest stewards can breathe, and when the system holds its character over time. The architecture fails when small misuse scales, when honesty becomes dangerous, or when the architecture begins to perform itself.

The final test, applied to any specific design choice: **can this be done twelve times in succession without burning out?** If the answer is no, the design is too heavy.

8.5 Practice is open, obligation is not

A central guardrail from SRIP applies to financial questions as much as to land practice: **practice is open; obligation is not.** Anyone may begin a bounded practice, download or adapt the formats, consider the three streams, or use colour language as a local reflection aid. None of this requires permission, relationship, or membership, and none creates an institutional claim.

But beginning practice does not in itself create entitlement to support, review, funding, or institutional relationship. Those things follow more slowly, and only where enough continuity, evidence, and trust are present. The architecture distinguishes clearly among three things:

1. **Practice** — beginning or continuing real local stewardship using the formats and the protocols.
2. **Recognition** — enough continuity for closer relational attention from a person or organisation that chooses to engage.
3. **Support** — some form of financial, operational, or institutional backing.

These are not the same. Not everyone who practises will seek recognition. Not everyone recognised will need support. Not everyone seeking support will enter an institutional relationship. SRIP offers possible pathways for thinking about this distinction, but the labels are descriptive rather than statuses automatically conferred by use of the materials.

A useful caution from SRIP is: **first stand, then help.** It invites each relationship to consider whether its own foundations are viable before taking on wider obligations. It does not establish a universal maturity sequence, funding ceiling, or supporter band.

8.6 The centre-burden test

A useful hypothetical test from SRIP asks: *if many more people did this tomorrow, would the centre become heavier?* The number sometimes used in this thought experiment is 10,000; it is not a forecast or target.

If the centre would become substantially heavier, the design needs reconsideration. Open materials should allow people to:

- download or adapt Format 5 without central processing;
- use the three-stream distinction without consultation with the association;
- adapt optional colour prompts without central onboarding; and
- begin local inquiry without creating a case file or claim on a central body.

This allows inquiry to remain open without pretending that publication creates an institutional relationship. Most engagement can remain local, while any formal relationship stays within the actual capacity of the parties and organisations involved.

Flow must not arrive faster than a living or institutional system can absorb without distortion. Large interest does not require central expansion. Local practice, independent adaptation, peer relationships, and deliberately limited formal commitments can coexist. Success is not measured by how many people an association processes.

9. Planetary context: why Regenerative Reciprocity is needed at scale

The architecture in the previous sections is operationally specific. This section places it in its planetary context. Regenerative Reciprocity is not a funding mechanism in search of projects. It is one response, among others, to a planetary condition. Without this context, the technical architecture floats free of why it matters.

9.1 Wealth concentration and time poverty

Two realities now exist side by side. On one side, an extremely small global wealth class holds an unprecedented concentration of capital. Recent reporting based on wealth-sector analysis places the global billionaire count above three thousand individuals, with projections toward nearly four thousand within five years. At the broader millionaire level, global financial-asset reporting continues to show large and growing concentrations, with substantial portions of global financial wealth held by a small fraction of the population.

On the other side, billions live without long-term security. The World Bank now defines extreme poverty as living on less than approximately three US dollars per day, and reports that hundreds of millions remain below that threshold. Many more live above it but remain structurally vulnerable to food-price inflation, illness, climate shocks, debt cycles, job disruption, and the loss of informal income.

This is not only an inequality problem. It is a **time-horizon problem**. A person living from day to day cannot easily plant a forest. A family without savings cannot easily wait five years for a food forest to root. A smallholder on degraded land cannot easily take ecological risks when the next harvest is needed for survival. Regenerative work requires time. Poverty removes time. The architecture in this report exists, in part, to give time back — to make it possible for people on land to enter regenerative practice without bearing the entire risk of the transition themselves.

9.2 The smallholder trap

A large part of the planetary crisis is carried by people who are not inactive but overactive under bad conditions. Smallholders, informal workers, land-based families, peri-urban growers, teachers, builders, repair workers, and local stewards often work continuously, yet remain unable to enter a positive spiral. The problem is not lack of will. The problem is the absence of surplus.

Without surplus, a farmer cannot easily shift to agroforestry, restore soil, plant trees with delayed yield, protect seed diversity, pause extractive cultivation, invest in water retention, participate in documentation, join a cooperative structure, or take part in long-term governance. Each of these requires resources that survival agriculture cannot generate.

Regenerative Reciprocity is therefore designed as more than support. It is designed to create the conditions under which people can move from survival work into stewardship work — from carrying the unfunded cost of ecological collapse to being supported in carrying ecological repair. The architecture's purpose is not to fund projects; it is to fund the time and stability that make stewardship possible.

9.3 Food sovereignty and the return of local capacity

Food sovereignty is not only about calories. It is about agency. It means that people and communities can shape their own food systems in ways that are ecologically, culturally, nutritionally, and economically viable. In the Spiralweb context, food sovereignty includes heirloom seeds, local seed banks, crop diversity, agroforestry, school gardens, food forests, local processing, intergenerational knowledge, access to land, local water systems, and community-based resilience.

This is directly connected to the architecture. A field that receives support should not become dependent on continuous external supply. It should gradually increase local capacity, local resilience, and local abundance. The reciprocity rule reinforces this: support enters until viability is real, and then circulates outward rather than continuing to flow inward.

The purpose is not simply to fund food production. The purpose is to restore the conditions under which communities can feed themselves with dignity.

9.4 Biodiversity, seed banks, and species protection

The biodiversity crisis is not an abstract background condition. The Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services has estimated that around one million animal and plant species are threatened with extinction, many within decades, unless drivers of biodiversity loss are reduced.

For Spiralweb, this means that regenerative finance must eventually become **habitat finance**. Support must not only ask what human project is being funded; it must also ask what habitat becomes possible, which species may return, which seeds are protected, which ecological relationships are restored.

This reframes the economic question. A restored field is not only a productive unit. It is a living interface where birds and insects may return, water behaviour can change, soil organisms may recover, seeds move, and human attention deepens. A bounded plot can make some of these changes observable at human scale, but no plot is a complete pixel of planetary reality and no ledger makes the planetary field fully readable.

9.5 Water, forests, and bioregional repair

Water is not only a resource. It is a pattern. The loss of forests, soils, wetlands, and mountain vegetation changes how water moves through a bioregion. The United Nations Convention to Combat Desertification has reported expanding drylands and the need for substantial investment in land restoration and drought resilience.

Restoring forests and tree-based systems can support water regulation, erosion control, habitat, carbon storage, and microclimate stability — but it must be done with hydrological intelligence. The Food and Agriculture Organization's forest-water guidance cautions explicitly against simplistic assumptions that "more trees always means more water"; the relationship depends on context, species, soils, climate, and landscape position.

This matters for the architecture in this report. The aim is not ideological tree planting. The aim is locally intelligent restoration: reforest where forests belong; protect mountain slopes where vegetation anchors water; restore riparian buffers; rebuild soil sponge capacity; support agroforestry where food and canopy can coexist; avoid water-intensive mistakes in drylands; follow local ecological knowledge alongside scientific assessment. In some places, the right direction may be native forest restoration; in others, syntropic agroforestry; in others, wetland repair, seed banking, grazing transition, or soil cover may be the immediate priority. The field must be allowed to reveal what it can become.

9.6 Regeneration is not one land use

A food forest is not a fixed product. It is a living succession. In the first years it is fragile. After several years it begins to root. Over time it may become something not fully predictable at the beginning. Some fields may become diversified food forests; some may become shaded cacao or coffee systems; some may become seed orchards; some may become mixed habitat and food systems; some may move toward semi-wild forest; some may remain intensively managed because local food needs require it.

The same is true socially. An AnchorPoint may begin with one person and a place. It may develop into a group, school network, village commons, regional learning node, or another locally appropriate form. It may remain small and precise.

Regenerative Reciprocity must therefore avoid forcing a single outcome. The proposal supports inquiry without prescribing development. Any reciprocal contribution must be shaped by what the field can actually carry, not by an external band.

9.7 War, resource vulnerability, and the return of basic systems

Global food-crisis reporting continues to connect severe food insecurity with conflict, weather extremes, economic shocks, displacement, and shortfalls in assistance. The exact scale changes from year to year; the enduring point for this report is that life-support systems become most visible when they fail.

The geopolitical lesson is clear: centralised life-support systems are vulnerable. When water systems fail, when fertiliser access is disrupted, when desalination plants are damaged, when food imports are blocked, when fuel prices shift, or when housing becomes unsafe, communities discover how dependent they are on distant systems they do not control.

Regeneration is therefore not lifestyle. It is **resilience infrastructure**. This includes local food production, seed sovereignty, water retention, soil repair, safe shelter, decentralised energy, community health resilience, local repair capacity, ecological buffers, and regional cooperation. Regenerative Reciprocity must be able to support not only beautiful landscapes but basic life-support capacity.

9.8 Cleaning, repair, and the moral work of restoration

Regeneration is not only planting. It is also cleaning. Many landscapes are damaged by heavy metals, polluted water, plastic waste, chemical residues, degraded soils, industrial runoff, abandoned infrastructure, extractive land use, deforestation, overgrazing, and erosion.

Restoration therefore includes unglamorous work: removing waste, testing soils, identifying contamination, rebuilding drainage, repairing water paths, fencing sensitive areas, composting, mulching, protecting young trees, maintaining tools, documenting failures. This matters because regenerative culture can become too symbolic if it does not include repair labour. Regenerative Reciprocity must therefore fund both visible transformation and invisible maintenance — the planted tree and the cleared waste site, the celebrated harvest and the documented failure.

9.9 The market interface: from survival land to ledgered abundance

Spiralweb does not reject markets as such. It rejects extractive market logic as the primary organiser of life. The long-term question is whether existing markets can be influenced, redirected, and partially re-patterned through higher-quality evidence, better governance, and non-extractive financial architecture.

This is especially relevant in relation to high-quality carbon credits, biodiversity credits, water-restoration finance, regenerative supply chains, smallholder aggregation, local food economies, and stewardship-based compensation. The danger is real: carbon markets can simplify living systems into tradable units and invite new forms of capture. The opportunity is also real: if smallholders and local stewards can document ecological improvement over time through PG Ledger, they may eventually access forms of value recognition that were previously unavailable.

The sequencing caution is: **field before market**. Market demand should not determine field reality. PG Ledger may support questions about land, steward viability, governance, finance, and evidence, but it cannot verify a market claim. Any future interface requires appropriate methods, assurance, legal review, and the informed agreement of the people affected.

9.10 Institutional capital, supply-chain accountability, and conscious co-created food systems

Institutional capital should not be excluded from Regenerative Reciprocity. The question is not whether capital may enter, but under what grammar it enters, what it is allowed to see, what it is allowed to claim, and whether the field remains able to refuse distortion. The architecture in this report is not anti-capital. It is anti-capture. It does not reject carbon finance, supply-chain finance, corporate food-system partnerships, or institutional investment as such. It rejects any arrangement in which capital becomes the first grammar of the field.

This distinction matters because institutional capital is already moving toward land, food, carbon, biodiversity, and nature-based systems. Carbon-pricing systems and voluntary credit markets have grown, but scale, liquidity, and climate language do not by themselves guarantee field integrity. Market figures change quickly and must be checked against current primary sources before they are used in an actual financing decision.

For smallholder agriculture, the risk is sharper. High upfront costs, uncertain demand, complex verification, tenure questions, and asymmetric bargaining power can leave local stewards carrying practice change, documentation burden, yield risk, and delayed benefit while other actors capture value through methodology, aggregation, verification, trading, branding, or reputation. These risks require case-specific legal, financial, and local review.

Regenerative Reciprocity therefore proposes a different sequence. Institutional capital may be designed in from the beginning, but carbon credits should not be the beginning. Early capital should first support field integrity: land relationship, steward viability, soil and water work, food sovereignty, local seed systems, baseline observation, PG Ledger practice, consent, governance, and benefit-sharing. Carbon-credit readiness may then be explored later, but only where the field has become strong enough to hold it. Credits may become a later instrument. They are not the first grammar of the field.

This is not a rejection of institutional capital. It is a sequencing caution. Field integrity, local practice, consent, evidence, and governance should precede any decision about measurement, insetting, contribution finance, or credit issuance. The timing cannot be standardised by this report. Some fields may become suitable for a market interface; others may remain climate-relevant without becoming credit projects.

The same discipline is needed in food supply chains. Much of the global food economy still operates through procurement systems that ask for volume, price, consistency, certification, and delivery, while the conditions that make food possible remain external to the transaction. Buyers may order large quantities through intermediaries with little or no contact with the local practice that produced the food, the soil conditions that were affected, the water systems that were stressed, the biodiversity that was lost or restored, or the human carrying capacity required to deliver the order. The visible value chain records purchase, transport, processing, retail, and margin. The invisible commons absorbs erosion, water depletion, seed loss, chemical exposure, unpaid care, land pressure, local food insecurity, and steward exhaustion.

This is the deeper supply-chain problem: many harms are not absent from the system; they are merely displaced from the balance sheet into the commons. They become externalities because no actor in the formal value chain is required to hold the full life cost of what the chain demands.

FAO's work on the hidden costs of agrifood systems shows why market price alone is an incomplete account of food. Environmental, social, and health effects remain partly outside the transaction. This is directly relevant here: price can become separated from the field conditions, human conditions, and commons conditions that make food possible.

European due-diligence law also addresses adverse human-rights and environmental impacts in corporate operations and value chains, although scope, timing, and obligations remain subject to legal and political change. Any practical reliance on these rules requires current legal review; the broader lesson is that harms outside a purchasing contract cannot simply be treated as irrelevant.

Voluntary target frameworks for forest, land, and agriculture add another layer of expectations for some land-intensive companies. Such frameworks change over time and are not law. They may increase demand for credible information about land-sector impacts, but they do not establish that PG Ledger or any Spiralweb method meets a particular assurance or reporting standard.

This is where **Conscious Co-created Food Systems** becomes relevant. A conscious food system is not only a supply chain with better claims. It is a co-created field relation in which food, soil, water, biodiversity, labour, culture, learning, and governance remain visible together. It asks not only what food is purchased, but what kind of field the purchase strengthens. It asks whether procurement supports local capacity or extracts from it; whether it strengthens seed sovereignty or narrows genetic diversity; whether it improves water retention or intensifies water stress; whether it supports steward viability or depends on unpaid overload; whether it builds local food resilience or channels value outward while leaving the commons depleted.

In this sense, PG Ledger may function as one field-reading surface alongside other evidence. It does not replace certification, scientific measurement, accounting, procurement contracts, due diligence, or food-safety systems. Its possible contribution is to hold carbon, biodiversity, soil, water, food, and human carrying capacity in the same conversation without claiming to verify them through one metric.

The aim is not to make local stewards serve supply chains. The aim is to make supply chains answerable to stewardship.

A conscious co-created food-system partnership should therefore follow several principles. *First*, procurement should not begin with volume. It should begin with field reading. *Second*, the buyer should not treat the local actor as a supplier only, but as a steward whose ecological and human carrying capacity matters. *Third*, price should not be the only economic signal; support may need to include transition finance, documentation support, local processing, seed systems, water infrastructure, and governance capacity. *Fourth*, carbon, biodiversity, water, and social claims should never be made faster than the field can document them. *Fifth*, the field must retain the right to say no to orders, claims, visibility, or credit pathways that would distort its work.

This creates a different capital interface. Institutional capital can enter as **stewardship capital**, not extractive capital: capital deployed to give time back, reduce transition risk, strengthen local practice, and build evidence before claims. It may take the form of grants, concessional capital, first-loss support, buyer-funded transition programmes, contribution finance, inseting, public procurement, or later high-integrity credit pathways. But in each case the sequencing remains the same: **field first, ledger second, market third**.

The mature position is therefore neither anti-market nor market-led. Spiralweb does not reject carbon finance or institutional capital. It rejects carbon-first and procurement-first field design. Capital may enter from the beginning, but it must enter as support for field integrity, not as a demand for premature claims, volumes, or tradable units.

If the architecture succeeds, it may eventually allow many smallholders and local stewards to interface with larger capital systems without being absorbed by them. But this will only be credible if the early architecture protects the field from the very distortions that later scale would otherwise amplify. The issue is not whether capital managers are bad actors, or whether local actors are fragile. The issue is that poorly sequenced

incentives can distort even good actors. Regenerative Reciprocity exists to make that sequence visible, governable, and correctable.

9.11 The role of wealth: from ownership to stewardship

The presence of enormous private wealth is one of the defining facts of the present historical moment. The question is not only whether wealthy individuals should give more. The deeper question is: **can wealth move without controlling what it touches?**

Regenerative Reciprocity explores how philanthropic capital might enter without becoming sovereign. A supporter may contribute to a place, shared infrastructure, ecological work, steward viability, learning, or repair where a responsible party has agreed the purpose. Support does not buy ownership, governance control, branding dominance, extraction rights, profit participation, or narrative control.

This is a cultural shift more than a technical one. **Wealth is invited to become compost, not command.** Capital that enters this architecture nourishes the field and is then absorbed into it; the donor does not retain a structural claim on what the field becomes.

The shift on the supporter's side is worth naming. Payment need not purchase influence. A supporter may help carry work without owning the project, controlling the narrative, or receiving governance standing. The exact relationship must nevertheless be stated in an agreement rather than idealised in advance. The financial form should follow the purpose and the people involved; it should not silently redefine them.

This recognition logic also describes how the architecture works at every other layer of support — member, field-level supporter, institutional partner. The architecture is not designed to convince anyone to give. It is designed to make it possible for those who already see the work to participate in carrying it, in a form that does not corrupt the relation.

9.12 Penguin Economics and the redistribution of burden

Penguin Economics gives this report its moral-economic logic. The image is of an emperor penguin colony in winter: the birds rotate continuously, those at the cold edge moving inward as those at the warmer centre move outward, so that no individual is forced to bear the full cost of exposure for too long. The colony survives because warmth circulates.

The principle, transposed to economic flow: in an exposed system, capacity must move toward the cold edge. Strong fields carry more. Fragile fields are protected. Burdens are redistributed. Surplus does not stop at the first successful node. Support follows vulnerability without rewarding dysfunction. Reciprocity begins only when abundance is real.

This is not charity. It is ecological economics. A living system survives because energy moves. A commons survives because obligation is distributed. A field matures because support and responsibility change over time. Regenerative Reciprocity is the operational form of Penguin Economics in the financial domain: it ensures that flow does not terminate at the first successful node, and that fragile nodes are carried by the capacity of stronger ones.

9.13 Alignment with the Rio Conventions: CBD, UNCCD, and UNFCCC

Regenerative Reciprocity does not present itself as an instrument of the international environmental conventions. It is a field-level economic and governance architecture designed for stewardship at the scale of real people in real places. But its operational reach overlaps significantly with the aims of the three Rio Conventions, and that overlap is worth naming clearly so that readers from biodiversity, land restoration, climate, foundation, municipal, and international policy contexts can locate the architecture within terms they already work with.

The **Convention on Biological Diversity (CBD)** asks how biodiversity, habitats, species, ecosystem integrity, and genetic diversity can be protected and restored. Regenerative Reciprocity supports CBD aims by making it possible to carry documented AnchorPoints where habitat, succession, local species knowledge, pollinators, wetland life, food forests, seed networks, and biodiversity indicators can be observed and supported over time. Format 2 (Observation Sheet) registers ecological reality across the eight observation categories — including biodiversity presence and succession signals — in a form that can be aggregated across the network without flattening local knowledge. Stream A funding can support seed banks, native nurseries, habitat restoration, and the slow ecological repair that biodiversity recovery actually requires. The field relationships described in Section 1.4 — including intergenerational syntropic work in Kitgum, a dryland agroforest pre-pilot in Doukkala, permaculture and water-retention practice at Had Soualem, and chinampa and axolotl stewardship in Xochimilco — point toward the concrete biodiversity and habitat work on which CBD outcomes ultimately depend.

The **United Nations Convention to Combat Desertification (UNCCD)** addresses land degradation, drought, desertification, soil depletion, water stress, and dryland fragility. The connection here is conceptual rather than a claim of formal alignment or compliance. The proposal asks how land and water restoration might be supported without extracting from stewards or reducing varied dryland contexts to a single hectare count. If stewards cannot remain viable long enough for ecological work to continue, institutional ambition alone is insufficient.

The **United Nations Framework Convention on Climate Change (UNFCCC)** asks how climate mitigation, adaptation, resilience, and climate finance can be organised. Regenerative Reciprocity contributes to UNFCCC aims primarily through adaptation and resilience: shaded cropping systems, water retention, food security, wetland recovery, school-based climate learning, soil sponge capacity, and the nature-based local systems that allow communities to remain viable as conditions change. Mitigation through carbon sequestration may emerge from this work over time, but the architecture refuses to lead with it. Carbon claims arrive credibly only after years of honest documentation, and only when they do not displace biodiversity, water, food sovereignty, or steward viability. The "ledger first, market second" sequence (Section 9.9), and the institutional-capital sequencing discipline (Section 9.10), together describe the operational form of this position with respect to climate finance.

Regenerative Reciprocity does not replace the Rio Conventions. It offers a field-level economic and governance architecture through which their overlapping aims can be carried by real people in real places. What the conventions can name as planetary obligations, this architecture is designed to make practical, local, bankable, and non-extractive at the scale where life actually changes.

One caution belongs with these possible points of contact. Climate finance, biodiversity markets, or convention-related funding can reduce fields to single market-readable indicators such as carbon tonnes, credits, hectare

counts, or donor metrics. PG Ledger may help keep several dimensions in conversation, but it does not prove alignment with the Rio Conventions or any funding standard. The proposed orientation is field before instrument and context before metric.

9.14 Why this report exists

This report exists because the regenerative movement needs more than inspiration. It needs legal forms, financial flows, field protocols, trust infrastructure, human care, evidence systems, repair mechanisms, anti-capture rules, and long-term time. Regenerative Reciprocity is Spiralweb's attempt to hold these together.

It asks: Can capital enter without capturing? Can vulnerable fields receive without becoming dependent? Can abundance emerge without becoming private extraction? Can smallholders enter positive spirals? Can biodiversity become visible as value without being reduced to commodity? Can local groups become strong enough to govern their own transitions? Can the existing economy be interfaced with without being obeyed?

These questions are not rhetorical. The architecture in the previous sections is the working answer. Whether it works will be determined by practice, not by argument.

10. Invitation to the regenerative field

The architecture in this report is offered to a wider regenerative field that already exists. This section addresses that field directly. Regenerative Reciprocity is not Spiralweb's exclusive property; it is a working proposal that other actors are invited to test, adapt, criticise, and improve.

10.1 To other regenerative organisations

The PG Ledger formats, the three-stream distinction, the optional colour prompts, and the safeguards discussed here are openly available under CC BY 4.0. They can be adapted, translated, criticised, or left aside without reporting back. Publication makes the materials available; it does not certify an implementation or create affiliation with Spiralweb.

Where the work remains recognisable, the licence asks for attribution, not submission to an institution. An organisation using Format 5 or the three-stream distinction is not bound to share results with the association and does not become part of it. The proposal is offered as a contribution to a wider commons of regenerative practice.

What the architecture asks of those who adopt it is fidelity to its underlying principles: practice is open and obligation is not; ecological ambition does not justify human depletion; documentation must not become exposure; reciprocity follows surplus and never need; growth cannot be commanded by funding. These are not Spiralweb's exclusive principles either. They are the principles the architecture is designed to operationalise. Where they are honoured, the architecture is being used well — regardless of whose name appears on the form.

10.2 To stewards considering whether to enter the network

A steward considering a formal relationship with Spiralweb should approach the decision with care. Reading a paper, using a format, beginning a bounded practice, or entering dialogue does not create recognition, verification, membership, support, or obligation. Those relationships exist only when the parties have explicitly established them.

A deeper relationship should make sense for everyone involved and should specify purpose, documentation burden, consent, roles, decision authority, resources, review, and realistic routes to pause or withdraw. No one should have to use all five formats or accept a public label as the price of relationship. Leaving an institutional relationship does not remove a person's practice or ownership of their own work.

10.3 To supporters

To supporters who recognise the work and wish to contribute, this report offers questions for further discussion, not an application route. Support may include a transaction, but it is held within a relationship. It does not buy ownership, governance, control, or narrative direction. Conditions for changing or ending support must be stated honestly in the actual agreement rather than promised universally by this report.

What a supporter may receive is the documentation and relationship explicitly agreed with the relevant parties. They do not thereby receive equity, governance influence, branding rights, extraction privileges, or authority over the field. The legal counterparty and the body authorised to accept or refuse conditions must be identified in each case; it is not automatically the association.

10.4 Professional capacities

A regenerative field may depend on people who carry a place, a practice, or a professional capacity such as ecological design, teaching, translation, documentation, accounting, legal advice, or facilitation. These descriptions can help clarify a role, but they are not fixed Spiralweb ranks or membership categories.

Professional capacity is neither a beneficiary status nor a free resource. Where work is requested, the role, responsible party, fair and lawful payment, conflicts of interest, confidentiality, and limits of authority should be explicit. Providing expertise does not itself create governance rights in a field, an AnchorPoint, Spiralweb Papers, or the association. The proper accounting classification depends on the actual contract and purpose, not on a title introduced by this report.

10.5 To public actors: municipalities, regions, ministries

Municipalities, regional authorities, ministries, and intergovernmental bodies may encounter this proposal as collaborators, commissioners, regulators, recipients of evidence, providers of land or coordination, or supporters. Their actual role must be established lawfully and specifically. Earlier reports offer related inquiry; they do not pre-authorise a collaboration.

A public body may legitimately be a commissioning authority, partner, funder, or regulator. The question is whether the role, public mandate, procurement duties, consent, evidence, and non-capture conditions are clear.

No public or private actor should use the proposal to appropriate local knowledge, suppress inconvenient evidence, or purchase control over a field.

What public actors can receive in return is real documentation of regenerative practice within their jurisdiction, evidence relevant to climate, biodiversity, food, and resilience policy, and access to a network of comparable practice in other countries. They can also receive honest signals about what does not work, which is often more valuable than the success stories conventional reporting privileges.

10.6 The shared invitation

The shared invitation across all of these audiences is straightforward. The architecture is open. The principles are open. The work is open. What is not open is the right to capture, control, distort, or extract. Within those limits, the field is wide.

The closing line of SRIP applies to this report as well: *is this practice giving to life?* If the answer is yes, the work continues. If the answer becomes no, the work pauses, recalibrates, or stops. The architecture in this report is the form within which that question can be asked honestly across many people, places, and economic flows over time.

11. Limitations and unknowns

This report describes a working proposal, not a completed or adopted architecture. Several limitations and unknowns are worth naming directly.

11.1 The first cycle has not been completed

At the time of writing, the proposed 90-day cycle has not been validated through a complete, independently reviewed operational cycle. Handbook scenarios are simulations rather than recorded proof. Figures and classifications are working material, not offers, rates, or commitments. Further revision is expected after real use, legal review, and correction by the people involved.

11.2 No common reciprocity rate has been established

No financial reciprocity rate has been validated across multiple years, fields, legal systems, and economic contexts. This edition therefore does not retain earlier percentage bands as guidance. Some relationships may later agree a modest financial contribution, others a non-financial form, and others none.

11.3 Cross-border banking remains a constraint

The proposal assumes that some cross-border transfers could be made bank-to-bank with documented purpose and identifiable parties. In some contexts this is straightforward; in others — including sanctioned countries, currency-controlled jurisdictions, or regions with limited banking access — it may be difficult or impermissible.

Country-specific legal, banking, tax, safeguarding, and compliance review would be required before any transfer.

11.4 The cultural condition cannot be guaranteed

Any honest field reading depends on a cultural condition that no format can produce: people must experience honesty as safer than performance. Responsible organisations can work toward this condition by not rewarding perfect scores, by accepting correction, and by sharing difficult learning only with consent. They cannot guarantee trust or eliminate strategic reporting.

11.5 The architecture's relationship to the existing economy is unresolved

Section 9.9 argues for field before market, but the relationship between Regenerative Reciprocity and existing market mechanisms — carbon credits, biodiversity finance, regenerative supply chains, or investment — is not worked out here. Until further research, legal review, and situated agreement exist, the report's position is restraint: publication does not establish readiness for a market interface.

12. Closing

The living field comes before the system.

The system is only good if it protects the field.

Money is necessary, and that is said clearly.

Money does not buy control.

The architecture must not depend on the steward absorbing its costs personally.

Romance without ledger becomes fog.

Ledger without romance becomes dead bureaucracy.

Together, they can become stewardship.

When abundance emerges, flow continues.

When fragility is present, fragility is protected.

If a field must perform green to be worthy of support, the architecture has already failed.

Regeneration is not primarily a project category.

It is a sustained posture of tending, observation, repair, and long-horizon responsibility.

Practice is open. Obligation is not.

Is this practice giving to life?

Revision note

This v0.6 edition identifies Spiralweb Papers as publisher and the named human steward once, removes vendor-specific AI credits, and clarifies that the report is a public inquiry rather than association policy or a governing treaty. It treats PG Ledger, colour readings, 10 m², and the Circle of 13 as optional inquiry forms; removes automatic status effects and fixed reciprocity bands; and distinguishes publication from adoption, activation, validation, agreement, and institutional authority.

Report 06 — Regenerative Reciprocity

Public report · v0.6 · September 2026
