Regenerative Reciprocity

Capacity, Earth Time, and Learning Across Places

Public working report · v0.8.1 · September 2026
Publisher: Spiralweb Papers
Accountable knowledge steward: Lars A. Engberg · CC BY 4.0

Abstract

This report asks how people and places may learn from one another, receive material support, and circulate capacity without turning one situated practice into a blueprint for another. It begins from a simple limitation: no distant centre can know enough to prescribe how a living field should develop. Scientific evidence, professional knowledge, public institutions, finance, and experience from elsewhere may all matter. None of them removes the authority, disagreement, history, and practical intelligence present in the place concerned.

Regenerative Reciprocity is therefore held here as an inquiry rather than a formula. It concerns the movement of more than money: time, attention, knowledge, tools, hospitality, protection, institutional access, and the capacity to begin again. Spiralweb contributes an open set of questions, records, and working formats to that wider inquiry. It does not claim to represent the regenerative field or know in advance what another community should do.

The report also widens the economic question. Ecological work unfolds in soil time, water time, seasonal time, and generational time, while people and institutions are often governed by project cycles, budgets, elections, debt service, and accelerated work. Housing costs, insecure livelihoods, administrative friction, stress, and lack of protected time may restrict a person's practical freedom to change direction even where formal freedom remains. A regenerative economy would have to ask not only how resources are allocated, but whether people and places retain enough time, security, and room to respond.

No completed model is presented. Existing practices are read as partial evidence that other arrangements are possible. The Spiralweb proposition is narrower: situated experiments can remain locally authored while becoming mutually legible, scientifically informed, publicly correctable, and easier to support. Whether this can occur without centralisation, hidden labour, romanticised community, or new forms of capture remains to be tested.

Any use of situated material remains subject to consent, privacy, provenance, and correction by the people concerned.

Editorial practice: AI-assisted and human-responsible. Method and responsibility.

Function and status

Report 06 is a public working inquiry. It is not policy, a funding programme, an investment product, an application route, or an operating standard. Publication does not activate a field, establish a partnership, confer recognition, or create an obligation to engage with Spiralweb.

Its function is to connect questions that are often separated: the viability of ecological work; the human capacity to carry it; the institutional rules that shape action; the movement of money and other resources; the different timescales in which consequences unfold; and the possibility of learning across places without exporting a model.

Detailed accounts of Moral Biology, Rule of Life, Penguin Economics, relational friction, the PG Ledger, and the wider Spiralweb architecture belong to their respective papers. This report does not restate them in full. It asks what becomes visible when they are brought into the same economic and relational inquiry.

> **How can capacity move between different places without the movement becoming instruction, extraction, dependency, or control?**

---

1. A place is not an empty site

International development, philanthropy, policy transfer, consultancy, and innovation programmes have often begun from a directional picture: knowledge is produced in

one place and delivered to another; a successful model is identified and scaled; external actors define the problem, timetable, evidence, and desired result. Useful knowledge has travelled through these arrangements, and people and institutions do sometimes invite advice, expertise, finance, or critical review. The problem is not contact with knowledge from elsewhere. It is the conversion of contact into authority.

A place is not a deficient version of somewhere else. People already interpret their conditions, disagree about priorities, carry histories, hold skills, and live with the consequences of decisions. External knowledge may disclose a mechanism, widen comparison, reveal a risk, or offer a technique. It cannot decide by itself what matters most, what may be carried, who has standing, or which trade-offs are legitimate.

This produces a discipline for cross-place learning:

- knowledge may be offered without presuming it is owed attention;
- a question may travel without its answer travelling with it;
- a method may be translated without being replicated;
- evidence may constrain a decision without replacing situated judgment;
- external criticism may remain necessary without becoming external command;
- a place may use, alter, combine, contest, or set aside what arrives.

Local authority is not the claim that a community is homogeneous, harmonious, or always right. Communities contain unequal access to land, money, language, time, safety, and public voice. Local power can silence as well as protect. Scientific findings, public law, rights, independent scrutiny, and the standing of people who dissent remain relevant. The alternative to outside prescription is not romantic enclosure. It is a more plural and answerable encounter.

Translation rather than replication

"Best practice" can be useful as evidence that something occurred under stated conditions. It becomes misleading when those conditions disappear and the result is treated as portable. Translation asks different questions: Which function mattered? What made it possible? What failed? Which resources were hidden? Which legal, ecological, cultural, and economic conditions differ here? What must remain recognisable, and what must change?

Scale is consequently not identical with making one organisation or method larger. A practice may scale when another place can begin its own inquiry without asking permission, while retaining access to shared evidence and the ability to return a correction. Federation, comparison, and interoperability may connect places without making them versions of one centre.

2. Friction, capacity, and the accelerated institution

Institutions do not lose capacity only through lack of money. Capacity is also bound in repeated verification, defensive documentation, handover loss, waiting, meeting inflation, fragmented responsibility, and systems that require people to retell the same situation. This is the economic proposition of relational friction: mistrust and poorly organised interfaces consume time, attention, health, and professional judgment even when the expenditure is distributed across separate budgets.

The aim is not frictionless government or frictionless life. Some friction protects: due process, professional standards, consent, translation, review, opposition, documentation, and the time required to understand a consequential decision. Other friction depletes without protecting. The analytical task is to distinguish them.

> **Necessary friction protects a rightful boundary. Destructive friction repeatedly consumes capacity without making the relation safer, wiser, or more accountable.**

This distinction matters in welfare states. Public provision can protect people from market dependence, pool risk, maintain universal services, and secure rights across a life course. The same institutions can also become overloaded, accelerated, and internally fragmented. A welfare system may spend substantial capacity responding after people have become ill, exhausted, homeless, isolated, or unable to work, while having less room to protect the conditions that might have prevented part of the damage.

This report does not claim that prevention automatically saves money, that stress has one institutional cause, or that a regenerative programme could replace welfare provision. It opens a more bounded question: where are public and collective resources already being used to manage recurring consequences, and could some capacity be moved earlier without weakening rights, service quality, or accountability?

Protected intervals

A sabbatical, retreat, residency, secondment, seasonal placement, learning period, or temporary refuge may create a protected interval in a life. The forms are not equivalent. Some provide rest; some enable research or practical work; some support

recovery; some make a professional transition possible; some simply give a person enough distance to notice what the normal rhythm concealed.

The possibility is neither trivial nor automatically regenerative. A retreat can become a privilege for those already secure. A residency can hide unpaid work. A liminal space without an economic floor can become precarity with an attractive name. A serious inquiry would therefore ask who can enter, who pays, what happens to housing and income, which work is expected, whether participation is voluntary, and whether a person can leave without penalty.

Protected time need not be justified only after breakdown. Some workplaces and educational environments distribute the cost of recurring sabbaticals across longer employment horizons. Other institutions enable paid leave, job rotation, continuing education, or temporary movement between practice and research. These arrangements suggest a wider proposition: renewal can be treated as infrastructure rather than as a private repair undertaken after capacity has collapsed.

---

3. Several clocks inhabit the same field

Living and institutional processes do not share one clock. A budget may close annually. An election may reorganise priorities after four years. A loan may claim income for decades. A funding programme may demand visible outputs within months. Soil structure, woodland succession, water systems, trust, recovery, apprenticeship, and intergenerational memory may require very different durations.

The mismatch becomes extractive when the fastest clock acquires authority over all the others. A living system is then required to perform readiness for a spreadsheet, a funder, a media cycle, or an exit horizon. Conversely, "long-term" authority can also become oppressive if present actors bind the future to an uncorrectable plan. Earth Time is therefore not simply slowness or a distant date. It is temporal governance: choosing rhythms that fit the process while retaining intervals for review, correction, pause, and succession.

The question is not only who owns an asset. It is which clock owns the decision.

Housing and practical freedom

Housing makes this temporal problem tangible. High housing costs, insecure tenure, long debt commitments, and distance between home and work may narrow the time and risk a person can make available for change. Someone may be formally free to

move, learn, build, care, or alter profession while having little practical room to do so. The report does not reduce housing systems to debt or assume the same conditions across countries. It treats housing security as one possible condition of human and stewardship capacity.

This opens questions rather than a settled proposal. Could non-speculative tenure, cooperative housing, community-held land, shared facilities, incremental building, paid transition periods, or other locally lawful arrangements create more room for people to contribute and adapt? Which building and planning requirements protect safety and collective interests, and which may create avoidable exclusion? How can experimentation occur without transferring risk to residents or weakening rights?

Debt relief is one possible subject of inquiry, not a current Spiralweb mechanism. A crucial distinction would apply. Relief tied to compulsory service could recreate dependency in a green form. Housing security and debt restructuring should not purchase a person's labour, loyalty, story, or future. Work requested in a stewardship field remains work and should be treated fairly and lawfully.

Time as a resource

Abundance includes more than accumulated assets. It may include time that has not already been sold, the ability to rest without losing one's home, a season in which observation can precede action, a maintained tool, an available room, knowledge that can be shared, an ecosystem retaining options, or an institution able to remember across staff turnover.

Nominal wealth and usable capacity are not identical. Neither are scarcity and lack of imagination. A field may contain overlooked materials, skills, spaces, relationships, and forms of care while lacking the interfaces through which they can meet. Frugal innovation, repair, circular practice, mutual aid, public provision, markets, and ordinary neighbourliness can each disclose capacity that a narrow financial account does not register.

---

4. Nodes that alter the question

No example below is presented as a complete model or Spiralweb affiliate. Each makes a different institutional possibility visible. Their value lies in comparison, including comparison with their limits.

Practice or node	What becomes visible	Question carried forward
Tzoumakers, Greece	An open rural makerspace in which tools for small-scale agriculture are designed and produced with users.	Can fabrication capacity stay embedded in agricultural practice rather than becoming a distant product pipeline?
Atelier LUMA, Arles	Design inquiry organised around a bioregion, local knowledge, invasive plants, agricultural by-products, algae, and industrial residues.	What new material economies appear when a place is read as a field of relationships rather than a supply of inputs?
Barefoot College	Women from rural communities learning technical solar practice and carrying it into their own places.	What travels when the person returns with capacity, rather than a remote organisation arriving with control?
Kudumbashree, Kerala	Federated neighbourhood groups connecting livelihoods, public programmes, and local government at very large scale.	How can human-scale groups federate without one centre replacing situated organisation?
Enspiral, Aotearoa New Zealand	A distributed network experimenting with participatory practices and mutual support for meaningful work.	Which common functions are necessary, and which capacities should remain distributed?
De Ceuvel, Amsterdam	A contaminated site used as a temporary circular and cultural laboratory.	Can a temporary institution be judged partly by what it repairs and leaves behind when its own period ends?

Practice or node	What becomes visible	Question carried forward
CIVIC SQUARE, Birmingham	Neighbourhood-scale civic infrastructure connecting learning, retrofit, organising, and doughnut-economics practice.	What can a neighbourhood hold when policy, practical work, and public imagination meet in one place?
Valldaura Labs, Barcelona	A forest setting connecting food, energy, fabrication, research, and learning.	What changes when production and education are situated inside the ecology they affect?
Pervasive Media Studio, Bristol	A shared workspace offered without desk rent, with active participation, interruptibility, and generosity forming part of the exchange.	Can hospitality, time, and knowledge exchange constitute an economy without being reduced to a fee?
Farmer Field Schools and social farming	Learning through observation and experiment in actual fields; farms also serving educational, social, and care functions.	How can a place carry several public functions without forcing them into one institutional category?
Future Design, Japan	Participants deliberate from the position of imagined future generations.	Can institutions make future consequence present without claiming to speak definitively for future people?
Future Generations Wales	Long-term thinking, prevention, integration, collaboration, and involvement made part of public working practice.	What changes when long-term consequence becomes a continuing institutional duty?

Practice or node	What becomes visible	Question carried forward
Future Library, Oslo	A forest and unread manuscripts held toward publication in 2114.	What can present institutions commit to when the initiating generation cannot receive the completed work?
Shikinen Sengu, Ise	Continuity carried through recurring rebuilding, material reuse, craft, and intergenerational transmission.	Can continuity reside in the capacity to renew rather than in keeping one material form unchanged?
The 10,000-year Clock	Longevity approached through maintainability, transparency, simple interfaces, restart, and evolvability.	What would institutions look like if they expected interruption and designed for unknown successors?
Patagonia's ownership structure	Economic rights and voting control divided between a purpose trust and a nonprofit owner.	Can accumulated organisational capacity be redirected without presenting one ownership structure as a universal solution?

Taken together, the examples do not describe a new sector. They cut across agriculture, art, welfare, design, technology, housing, education, public administration, business, and ecological restoration. Their shared interest is not organisational form but institutional plasticity: an ability to recombine roles, times, materials, and kinds of knowledge while remaining answerable to a real situation.

The important activity may also occur between nodes. A grower enters a research environment; a researcher spends a season in practice; a public employee tests a policy assumption with people who carry its consequences; a craftsperson helps a place adapt a tool; a person in transition finds a protected interval in which another direction becomes possible. The node matters because it can host the passage, not because everything should remain inside it.

5. AnchorPoints, GreenHubs, and abundance cradles

Spiralweb uses **AnchorPoint** for a continuing, situated relationship around a place or practice. An AnchorPoint is not created by publication, external recognition, or use of a format. It depends on actual people, continuity, consent, and the capacity to correct how the relationship is described.

GreenHub is held more openly in this report. It may describe a place, interval, or hosting function where different capacities can meet: land and research, making and policy, recovery and work, city and countryside, local knowledge and planetary evidence. It need not be a permanent building, branded programme, or central hub. It may be seasonal, mobile, distributed, or designed to end.

Abundance cradle is an exploratory phrase, not a status. It names the possibility that a place or relation leaves participants with more usable capacity: stronger skills, healthier soil, shared tools, new relationships, protected time, better questions, renewed confidence, or the ability to form another connection. The phrase makes no claim that conflict, scarcity, or unequal power have disappeared.

These three terms therefore do different work:

- the AnchorPoint holds continuity and situated accountability;
- the GreenHub hosts encounters and passages across established categories;
- the abundance cradle asks whether the encounter increased the capacity to continue and connect.

They are not stages. One place may carry several functions; another may use none of the terms. A successful hosting function may shrink, move, federate, or disappear after distributing what it held. Organisational survival is not the only measure of regenerative consequence.

Human-scale coordination

A **Circle of 13** names a memorable scale of approximately ten to fifteen people: small enough for people to know and answer one another directly, and large enough to hold meaningful difference without immediately relying on representation. It is not a magical number, universal optimum, entry requirement, or source of legitimacy. Larger fields may require multiple circles, delegation, representation, and institutions capable of resolving conflicts that face-to-face relations cannot settle.

6. A light common grammar

Learning across places requires enough common form for an observation or correction to travel. Too little form leaves experience isolated or dependent on personal memory. Too much form makes the grammar a hidden standard and reorganises places around what the centre can read.

The PG Ledger is Spiralweb's current attempt to hold that tension. It is a memory and correction layer, not a central database of truth. Its five optional formats concern a recurring human reading, situated observation, bounded action, decision memory, and financial flow. They may be adapted, translated, combined, or set aside according to purpose, consent, law, and local usefulness.

The formats keep three realities visible:

1. **Land and Ecology** — soil, water, biodiversity, food, habitat, and regeneration.
2. **Steward Viability** — time, livelihood, rest, health, agency, learning, and succession.
3. **Coordination and Governance** — roles, consent, conflict, decisions, accountability, and correction.

The realities are non-compensatory. Ecological improvement does not erase human depletion. Payment does not erase ecological harm. Clean administration does not erase either. This does not create an automatic decision rule; it prevents one reality from disappearing while people make a situated judgment.

A useful shared record remains modest. It distinguishes observation from inference, identifies place and time, preserves uncertainty and dissent, records who made a consequential decision, and leaves a route for correction. It does not require a field to describe itself primarily in Spiralweb language.

Planetary conversation, situated authority

Planetary evidence matters because climate, biodiversity, pollution, finance, supply chains, migration, and technology exceed local boundaries. Situated authority matters because consequences arrive in particular bodies, places, institutions, and histories. Neither scale contains the whole.

The relation can be expressed without choosing one side:

> **Evidence travels. Questions travel. Techniques travel. Authority does not travel automatically with them.**

A shared grammar is useful when it helps different accounts meet without making them identical. Its legitimacy remains provisional and functional: does it help people notice, compare, decide, remember, and correct? If it increases reporting burden, excludes people without technical access, or routes interpretation back to one centre, it requires revision.

---

7. Regenerative Reciprocity, narrowed

Earlier versions of this report placed strong emphasis on a future outward circulation of surplus from strengthened AnchorPoints. The possibility remains meaningful, but it has not been demonstrated by a completed Spiralweb field cycle. It should not carry the report as though it were an operating result.

Regenerative Reciprocity is held here more broadly and more cautiously:

> **Regenerative Reciprocity is the possibility that support, knowledge, time, and other forms of capacity can enter a living field, strengthen its ability to continue, and sometimes move onward by free and situated agreement without purchasing control.**

The final movement is possible, not owed. Receiving help creates no moral debt to Spiralweb, a supporter, or another field. Reciprocity is not repayment, investor return, franchise fee, compulsory gratitude, or a test of maturity. A contribution may be financial or non-financial, immediate or much later, directed toward shared infrastructure or elsewhere, or absent.

Before any outward movement is considered, the people responsible would need to ask whether apparent abundance remains after fair payment, existing obligations, ecological reinvestment, rest, reserves, risk, and locally defined needs. No universal percentage or colour can answer that question. If doubt remains, the doubt protects the field.

The proposition does not depend on exceptional altruism. People already teach, host, repair, volunteer, exchange skills, care for places, participate in associations, and support work they find meaningful. Markets, public systems, gifts, mutual aid, and cooperative forms coexist in ordinary life. The inquiry is whether these plural relations can become more viable and mutually supportive without unpaid care being romanticised or living value being reduced to price.

Money enters an existing relation

Money can protect time, obtain materials, pay skilled work, maintain infrastructure, distribute risk, and make continuity possible. It can also accelerate, standardise, expose, or buy influence. The relevant question is not whether money is pure, but what authority and conditions accompany it.

Where financial support enters, its legal holder, purpose, conditions, decision rights, payment type, and routes to correction must be identifiable. Spiralweb's current three-purpose distinction can help keep land and ecology, steward viability, and governance visible. Format 5 may connect a financial entry to its stated purpose and later observation, while formal accounting remains with the responsible legal person or organisation.

Support must not silently purchase land, data, story, future production, organisational loyalty, or local judgment. Nor should local knowledge be treated as a free input while external professional work is fully priced. These are design commitments to be tested in actual agreements, not guarantees created by this report.

---

8. Rule-altering inquiry without exception

Many inherited rules were made for conditions, categories, and institutional divisions that may no longer fit the problem at hand. People can participate within those rules, and they can also inquire into how the rules themselves might change. This is the rule-altering dimension of democratic and constitutional life.

Nothing here authorises a suspension of Rule of Law. Rule of Life is not an ecological exception, an emergency power, or permission for an organisation to claim that it speaks for life. Rights, lawful procedure, evidence, proportionality, professional duties, representation, opposition, courts, and independent scrutiny remain part of legitimate experimentation.

A bounded experiment might temporarily alter a specific procedure, resource relation, division of work, use of a place, documentation practice, or collaboration across institutions. It would need a stated question, lawful authority, people with standing, a limited scope and duration, a non-waivable floor, transparent decisions, routes to dissent and remedy, and a real possibility of stopping or reversing the experiment.

The purpose is not to create a law-free zone. It is to create constitutional room for learning.

Possible fields of inquiry include protected sabbaticals; exchanges between practitioners, researchers, and public employees; social farming; local fabrication; new combinations of housing and shared facilities; community-held land; stewardship livelihoods; preventive welfare practice; food forests and nurseries; climate adaptation teams; and forms of finance that release capacity without buying command. Their inclusion here is not endorsement or a programme. Each would require its own evidence, local authorship, legal assessment, and correction.

---

9. AI, public memory, and critical friendship

AI-assisted work changes the practical threshold for comparing large bodies of text, connecting discussions across disciplines, translating provisional accounts, and maintaining a public record over time. A practitioner with a phone, a researcher, a local group, or a small institution may be able to participate in a wider knowledge process with less publishing infrastructure than previously required.

This possibility is not yet proof of equal access or democratised knowledge. Language, connectivity, time, education, safety, model design, subscription costs, and the capacity to challenge fluent output remain unevenly distributed. AI can amplify an already strong voice, fabricate coherence, erase disagreement, reproduce dominant categories, and make one editor's grammar appear collective.

For that reason, the relevant public object is not a supposedly neutral AI answer. It is a correctable inquiry with visible provenance: what material entered, what was observed, what was inferred, what the system proposed, what a human selected, what remains uncertain, and who may answer back.

Selected conversations, field returns, revision notes, and evidence records may make learning inspectable where privacy, consent, safety, and relevance permit. Raw disclosure is not automatically ethical; a complete transcript may expose people, overwhelm readers, or confuse volume with accountability. The public form should be sufficient for criticism without making another person's life into open data.

Critical friendship is the relational method: close enough to understand the work, independent enough to challenge it, and committed enough to want it more truthful. Invited critical friendship does not replace journalism, courts, opposition, peer review, or uninvited criticism. It adds a form through which engagement and correction may remain in contact.

---

10. What Spiralweb can and cannot presently claim

What exists

- a public, versioned body of papers, reports, hypotheses, protocols, and working formats;
- two connected public sites with different functions;
- a forming association with its own legal and governance responsibilities;
- several existing place-based relationships at different levels of development;
- a human-held, AI-assisted editorial and research practice;
- working distinctions among ecological condition, steward viability, and governance;
- an open invitation to use, challenge, translate, or set aside published material.

What has not been demonstrated

- that the architecture transfers across cultures, institutions, languages, and economic conditions;
- that shared grammar will distribute authority rather than centralise interpretation;
- that AI-assisted participation lowers thresholds for people who do not already possess substantial capacity;
- that the PG Ledger improves local judgment over years without becoming a reporting burden;
- that resources can enter multiple fields without supporter capture or hidden work;
- that genuine abundance will emerge and circulate outward;
- that GreenHubs or protected intervals can be made accessible without becoming privilege, precarity, or a new programme category;
- that the centre can remain light if wider interest grows.

These are not ceremonial limitations. They identify the work that observation, field returns, scholarship, legal scrutiny, and practice would need to test.

---

11. A research agenda rather than a roadmap

The next movement is not to export a model. It is to formulate questions that different places can answer in their own terms while preserving enough context for comparison.

1. **Capacity.** What currently prevents people from carrying work they regard as necessary, and which constraints are material, relational, institutional, temporal, or self-imposed?
2. **Friction.** Which delays, procedures, and boundaries protect something important, and which repeatedly consume capacity without doing so?
3. **Time.** Which clock governs the decision, and does it fit the process whose consequences are being judged?
4. **Housing and livelihood.** Which forms of security make experimentation possible, and which arrangements bind people or transfer risk?
5. **Knowledge.** What is known locally, what requires specialist inquiry, what remains uncertain, and who has standing to correct the account?
6. **Authority.** Who frames the question, chooses the evidence, makes the decision, carries the consequence, and can say no?
7. **Support.** What would strengthen the field without purchasing its direction, identity, data, or story?
8. **Return.** What locally meaningful return follows from documentation or research, and who decides whether it was meaningful?
9. **Scale.** Did the work enable another trustworthy relation or merely increase the load and visibility of the centre?
10. **Ending.** Can the initiative pause, decompose, or transfer its functions without treating organisational continuation as the only success?

A Field Return need not answer all ten questions. A single situated observation may be enough to correct a general proposition. The return completes a shared learning movement only when something useful also returns to the people or place from which the knowledge came, in a form they recognise as meaningful.

---

12. Closing — a contribution to a larger field

There is no empty world waiting for a northern organisation, a funder, a consultant, a platform, or an AI system to explain it.

There are people and places already observing, arguing, caring, working, refusing, adapting, and imagining. There are also scientific findings, legal obligations, public institutions, technologies, and experiences from elsewhere that can matter greatly. The possibility lies in the encounter: distinct knowledge meeting without one grammar possessing the whole.

Spiralweb is one node in that wider field. Its contribution is a public memory, an evolving set of questions and formats, several relationships, and a willingness to expose its own hypotheses to correction. The work will not be validated because it is coherent on paper. It will be tested by whether people elsewhere can meet it without becoming cases inside it; whether support strengthens rather than directs; whether difficult evidence can remain visible; and whether another place becomes more able to form its own connections.

Regenerative Reciprocity remains the name of a possibility: that time, knowledge, attention, hospitality, material resources, and money can move in ways that leave living fields more capable of continuing and more free to answer back.

> **The question is not how to make the world follow one road. It is how to make more room for truthful paths to meet.**

The next movement may be use, criticism, translation, refusal, pause, an unexpected alliance, or a return from a place that changes the question.

That is enough for a beginning.

Revision note

Version 0.8 reconstructs Report 06 as an inquiry into cross-place learning, capacity, friction, Earth Time, protected intervals, institutional experimentation, and support without transferred authority. It retains the operational core of AnchorPoints, three non-compensatory streams, optional PG Ledger formats, local correction, and voluntary outward circulation while withdrawing any implication that Spiralweb holds a transferable blueprint or demonstrated reciprocity economy. It adds comparative nodes as questions rather than models, distinguishes local authority from

romanticised community, and states more clearly what has and has not been demonstrated.

Version 0.8.1 shortens the process disclosure without changing the inquiry, its evidence boundaries, or its operational core.
